Appendix		117
A.1	Destination Driver MEL Events Decoder	117
A.1.1	FIBRE DRIVE-SIDE INTERFACES ONLY	117
A.2	LOOP-ID to ALPA conversion table	120
A.3	Engenio Host Sense Data and ASC/ASCQ codes	121
A.3.1	Host Sense Data	121
A.3.1.01	Request Sense Data Format	121

A.3.1.02	Incorrect Length Indicator (ILI) - Byte 2	121
A.3.1.03	Sense Key - Byte 2	122
A.3.1.04	Information Bytes - Bytes 3-6	122
A.3.1.05	Additional Sense Length - Byte 7	122
A.3.1.06	Command Specific Information - Bytes 8-11	122
A.3.1.07	Additional Sense Codes - Bytes 12-13	122
A.3.1.08	Field Replaceable Unit Code - Byte 14	122
A.3.1.09	Sense Key Specific Bytes - Bytes 15-17	124
A.3.1.10	Recovery Actions - Bytes 18-19	124
A.3.1.11	Total Number Of Errors - Byte 20	124
A.3.1.12	Total Retry Count - Byte 21	124
A.3.1.13	ASC/ASCQ Stack - Bytes 22-25	124
A.3.1.14	Additional FRU Information - Bytes 26-33	124
A.3.1.15	Error Specific Information - Bytes 34-36	128
A.3.1.16	Error Detection Point - Bytes 37-40	128
A.3.1.17	Original CDB - Bytes 41-50	128
A.3.1.18	Host ID - Byte 51	128
A.3.1.19	Host Descriptor - Bytes 52-53	128
A.3.1.20	Controller Serial Number - Bytes 54-69	128
A.3.1.21	Array Software Revision - Bytes 70-73	128
A.3.1.22	LUN Number - Byte 75	128
A.3.1.23	LUN Status - Byte 76	128
A.3.1.24	Drive Software Revision - Bytes 79-82	129
A.3.1.25	Drive Product ID - Bytes 83-98	129
A.3.1.26	Array Power-up Status - Bytes 99-100	129
A.3.1.27	RAID Level - Byte 101	129
A.3.1.28	Drive Sense Identifier - Bytes 102-103	129
A.3.1.29	Drive Sense Data - Bytes 104-135	129
A.3.1.30	Sequence Number - Bytes 136-139	129
A.3.1.31	Date and Time Stamp - Bytes 140-155	129
A.3.2	Sense Codes	129
A.3.2.1	Sense Keys	129
A.3.2.2	Additional Sense Codes And Qualifiers	130
A.4	Industry Standard ASC/ASCQ Codes	144
A.4.1	SCSI ASC/ASCQ Table Format Explanation	144
A.4.2	SCSI ASC/ASCQ Assignments	144
A.5	SATA ASC/ASCQ Codes	159
	Subject Index – Volume 1	160
	Subject Index – Volume 2	162

1. Introduction

This document is intended for Engenio, OEM, Reseller Engineers and Technical Support personnel as a reference source when working with Engenio based storage systems. It includes useful commands to determine controller, drive and volume/LUN status; the usage and meaning of general debugging commands; and explanations of commands for analyzing controller behavior. Not all of the available commands are listed in this document, only the most common and/or useful commands.

Additional reference material has been included such as command line interface usage, scripting, host specific information, white papers and reference tables plus any other documents that may be of benefit to support personnel.

This document is divided into two volumes. The first volume covers shell commands for firmware versions 04.xx to 06.15 plus items mentioned in the previous paragraph. Some of the shell commands may still be used at firmware levels above 06.15. The commands listed in Volume 1 that are still used with the newer code levels, as well as some of the replacement commands of the newer code levels, are listed in a chart in Volume 2, Chapter 2. Also in Volume 2 are shell commands and other items unique to firmware beginning with 06.16. At the end of both volumes is an index of both Volume 1 and Volume 2 for easy of use and cross-reference purposes.

Any suggestions for additions, deletions, changes, comments and/or remarks are welcome and should be forwarded to Steve Gragert (steve.gragert@lsi.com), Engenio Storage Group, LSI Logic, Inc.

Important Note:

THE INFORMATION CONTAINED IN THIS DOCUMENT, THE COMMANDS SHOWN, AND THE CODE IMPLEMENTATION IS SUBJECT TO CHANGE WITHOUT NOTICE.

THIS IS FOR REFERENCE ONLY AND DOES NOT, NOR INTENDED TO, COVER ALL PROBLEMS AND/OR METHODS OF MAINTENANCE.

THIS DOCUMENT IS NOT INTENDED FOR END-USERS.

3. Shell Commands - Usage and Explanation

3.1 Starting the Shell

NOTES:

- A shell connection can also be gained via an **rlogin** session from a UNIX terminal window if the Ethernet ports have been setup for network use. (See section 3.2.7.06 for setting up the networking option.) The **telnet** connection is NOT supported on Engenio arrays.
 - As of 05.4x code, **rlogin** is disabled by default. In order to use **rlogin**, use the storage management software to enable it.
 - Later versions of code may ask for a user ID, use **root** then enter the password.
- Connect to the serial port (controller 1 or 2) on the controller module
 - Configure serial port - default array settings are 9600 (38,400 for SHV and RAID Core (RC) controllers), 8, None, 1, and no flow control. Serial port speed setting can support upto 115,200
 - Shell download protocol is Xmodem.
 - Enter **ALT-B** for control-break if using ProComm Plus.
 - For ProComm Plus, use **ALT-F6** to scroll screen.
 - For additional information on attaching to the serial connection, see Appendix A.4.
- Forget your password? Download NVSRAM again, the default (infiniti) will be used.
- Login shell is the Korn Shell.
- Use **ESC-K** to repeat the last commands.
- Use **lkup "name"** to print command variables with string "name" in their names(ie. **lkup "cfg"** will give a listing of all commands that have "cfg" in their name). This is not a man page.
- Enter **ld </Debug** to load the debug utilities.
- Enter **unld "Debug"** to unload the debug utilities.
- Enter **exit** to quit the shell commands, use **logout** if rlogin connection is used to release connection and exit.

```

Press within 5 seconds: <ESC> for SHELL, <BREAK> for baud rate

3.2 Shell Commands

3.2.1 Quick Overview of Commands

NOTE: When using commands that refer to the channel (ch) and ID numbers the numbers are logical numbers of the devnum. This does NOT refer to the physical location of the drive.

Each devices location may be represented in one of several ways:

Hex mode	0x00c0000i	(c=logical channel, i=logical ID)
Dec mode	ch,id	(ch=logical channel, id=logical ID)
phyDev mode	0xffffffff	(memory address in a controller)
Tray/Slot	T/S	(physical location)
ALPA	xx	(Arbitrated Loop Physical Address)

Shell Commands to display VOLUME/Drive Status

Command	Usage
cfgPhy <ch, id>	Displays contents of internal phydev structure
cfgPh <ch, id>	Displays piece header structure from dacstore & update time stamp
cfgPhyList	Displays brief list of all drives in storage system
cfgPbDev <ch,id,volume>	Displays a unit's config from a given drive (drive must be spun up)
cfgUnit <volume>	Displays detailed VOLUME information from memory
cfgUnitList	Displays VOLUME state for all VOLUMES
cfgShow	Display device information used by the Virtual Disk Driver
vdAll cmd	Performs cmd for all existing VOLUMES (e.g. vdAll vdShow)
vdShow	Displays detailed information about VOLUME configuration
ghsList	Display information about GHS drives

Shell commands to display RDAC status

Command	Usage
arrayPrintSummary	Prints summary of array controller states, VOLUME ownership
arrayPrint	Prints detailed controller state information

Shell Commands to modify VOLUME/Drive Status

Note (1) the controller will spawn a task to execute the shell command with isp prefix

(2) devnum is specified as 0xC0000I, where C is the 0-relative channel number and I is the id

Command	Usage
isp cfgFailDrive,0x<devnum>	fails drive specified by devnum
isp cfgPrepareDrive,0x<phydev>	Spins up a drive but will not make drive operational
isp cfgReplaceDrive,0x<devnum>	Replaces drive specified by devnum
isp cfgSetDevOper,0x<devnum>	sets drive status for drive specified by devnum to optimal (no reconstruct)
isp cfgDelVdisk,<volume>	Deletes a volume

Shell Commands to modify RDAC status

Command	Usage
isp rdacMgrSetModeActivePassive***	Sets controller mode to active and alternate controller mode to passive
isp rdacMgrSetModeDualActive***	Sets array controller mode to dual active
isp rdacMgrAltCtlFail	Fails alternate controller (holds in reset) and takes ownership of VOLUMES
isp rdacMgrAltCtlResetRelease	Releases failed controller from being held in reset

***WARNING: These commands do not modify the controller cache setup, only the controller states. This may be accomplished by issuing the following command:

isp ccmEventNotify,0x0f

Other Useful Shell Commands:

Command	Usage
showEnclosures	Displays information about enclosure devices
ld < /Debug	loads debug symbols (Use moduleShow to determine if debug is loaded)
unld "Debug"	Unloads debug symbols (Use moduleShow to determine if debug is unloaded)
printBatteryAge	prints current, installation, expiration and warning time, both in number of seconds since UNIX time zero - 1Jan1970
rpaGetBatteryAge	prints the life of the battery in number of 90-day increments in decimal, hex, and ASCII. This is the format (in hex) that the NVSRAM UserCfg Region uses to set the life of the battery (e.g. 2 yrs. = 0x08).
i	list summary task information
I	list detailed task information, memory usage
sysWipe	*** WARNING: deletes arrays volume configuration information including volumes, volume groups, volume-to-LUN mappings, hot spare assignments and array name.
sysWipeZero	*** WARNING: similar to sysWipe but also wipes net information.
safeSysWipe	*** WARNING: wipes the security region which contains Enabler ID numbers. After running this command any premium features will show up as "Out Of Compliance" and will require new keys.
reboot (or ^x or ^X)	reboots controller (like host bus reset)
sysReboot	reboots controller (like power on reset, via Boot Menu)

Dumping Global User Config Region Data on Bridge Controllers only
d 0xc1180,80,1

Dumping NVSRAM FA Log Region Data
 NVSRAM FA Log Region

05.xx code and earlier **d 0xc1250,200,1** (Bridge controllers only)
 06.xx code and later **excLogShow** (Works on all controllers)

3.2.2 Drive/VOLUME Status Commands

3.2.2.01 **cfgPh <ch,id>**

This command displays piece header structure from dacstore and update time stamp that is read directly from the dacstore on the drive at ch,id. The drive must be spun up in order to read this information.

To read the cfgPh of all of the disk drives in the storage system use the command: **isp cfgPhydevAll,cfgPh**

```

-> cfgPh 1,12
pt_magicnum      = 56445054
serialnum        = 427100c5
pt_timestamp     = 4271081e
update_timestamp = 4271365d
numDescPieces    = 1
vd_unit=5  offset=0  vd_update_timestamp=0000365d timestamp=4271365d
```

3.2.2.02 **cfgPbDev <ch,id,volume>**

This command displays volume definition stored in dacstore on spun up drive at ch,id (similar to the output of the command **cfgUnit**).

Piece Service State of the drive, not the drives state or status
 3 = in-service
 4 = out-of-service

```

-> cfgPbDev 2,2,3
vd_serialnum = 41221e45
vd_timestamp = 41221e08
vd_state = 0
vd_status = 0
vd_flags = 7270f
vd_capacity = 31f8ba00
vd_unit = 3
vd_type = 7
vd_pieces = 4
vd_lun_type = 1
vd_blocksize = 512
vd_recon_freq= 0
vd_recon_amt = 1024
vd_cluster = 128

phydev address	= 47c82348	Memory location in controller		
nextphy	= 47c84bd8	Next drive in the list		
d state	= 0000	Drive State		
d status	= 0000	Drive Status		
d flags	= 00200000 =	Drive Flags		
d timestamp	= 3f5c8b86	Timestamp of last update		
drive group seq #	= 2	Volume group number		
brd_serialnum	= 31543330323237333130000000000000	Serial Number of controller at the higher drive-side SCSI ID		
abrd_serialnum	= 31543235303136353635000000000000	Serial Number of controller at the lower drive-side SCSI ID		
dacstore_name	= 00100003	Physical location of drive when DACStore was created (the same as the drive identifier, if the drive has not been moved within the subsystem)		
dacstore_serialnum	= 3f5c9cc3	Timestamp when DACStore was created		
dacstore_major/min	= 3,0			
dacstore_update	= 0			
devnum	= 00100003	Drive identifier(ch,id in hex mode)		
tray,slot	= 0,11	Drives physical location		
d_blksize	= 512	Drive block size (typically 512)		
numDescPieces	= 5	Number of VOLUMES configured on drive		
offset	= 00000028	Offset of first VOLUME piece on drive		
pIndTab	= 00000000			
ckptLog	= 00000000			
dkpc[0]=447a44fc dkpc[1]=447a3ff8 dkpc[2]=447a3cc8 dkpc[3]=447a383c dkpc[4]=447ae174		phyDev address of each volume piece on a drive		
d_capacity	= 71132960	0x043d6720	Drive Capacity in hex blocks	
d_data_start	= 0	Start of user data area on drive		
d_data_end	= 71051039	0x043c271f	End of user data area on drive	
dacstore_start	= 71051040	0x043c2720	Start block number of DACStore 1 + End of user data area on drive	
Number phydevs	= 1	Number of phydev definitions (should always be 1. If value is 2 suspect dirty dacstore.)		

DRIVE STATE Values:

0	Optimal	5	Removed - optimal	pg2A = 0
1	Non-existent drive	6	Removed - replaced	pg2A = 4
2	Unassigned, w/DACSTORE	7	Removed - failed	pg2A = 3
3	Failed	8	Unassigned, no DACSTOR	
4	Replaced			

DRIVE STATUS Values:

0x0000	Optimal	0x00A4	Reconstruction failed
0x0001	Unknown Channel	0x00A5	Drive failed at Read Capacity
0x0002	Unknown Drive SCSI ID	0x00A6	Drive failed for internal reason
0x0003	Unknown Channel and Drive SCSI ID	0x00B0	No information available
0x0080	Format in progress	0x00B1	Wrong sector size
0x0081	Reconstruction in progress	0x00B2	Wrong capacity
0x0082	Copy-back in progress	0x00B3	Incorrect Mode parameters
0x0083	Reconstruction initiated but no GHS is integrated	0x00B4	Wrong controller serial number
0x0090	Mismatched controller serial number	0x00B5	Channel Mismatch
0x0091	Wrong vendor - lock out	0x00B6	Drive Id mismatch
0x0092	Unassigned drive locked out	0x00B7	DACStore inconsistent

0x00A0	Format failed	0x00B8	Drive needs to have a 2MB DACStore
0x00A1	Write failed	0x00C0	Wrong drive replaced
0x00A2	Start of Day failed	0x00C1	Drive not found
0x00A3	User failed via Mode Select	0x00C2	Drive offline, internal reasons

DRIVE FLAGS (d flags) Values:

0x00000100	Drive is locked for diagnostics
0x00000200	Drive contains config. sundry
0x00000400	Drive is marked deleted by Raid Mgr.
0x00000800	Defined drive without drive
0x00001000	Drive is spinning or accessible
0x00002000	Drive contains a format or accessible
0x00004000	Drive is designated as HOT SPARE
0x00008000	Drive has been removed
0x00010000	Drive has an ADP93 Dacstore
0x00020000	Dacstore update failed
0x00040000	Subvolume consistency checked during SOD
0x00080000	Drive is part of a foreign rank (cold added).
0x00100000	Change vdunit number
0x00200000	Expanded Dacstore parameters
0x00400000	Reconfiguration performed in reverse VOLUME order
0x00800000	Copy operation is active (not queued).

3.2.2.04 cfgPhyList

Displays drive list giving devnum, tray/slot, phydev address, state and status

```

-> cfgPhyList
Ch Devnum Phydev State/Status Flags #Pcs Dg# T/S
0 000007 47c79550 OPTIMAL/NULL 00200200 0005 2 0/7
0 000006 47c7bde0 UNASSIGN/NULL 00200200 0000 0 0/6
0 000005 47c7e670 UNASSIGN/NULL 00200000 0000 0 0/5
0 000004 47c80f00 OPTIMAL/NULL 00200000 0005 2 0/4
0 000003 47c83790 UNASSIGN/NULL 00200000 0000 0 0/3
0 000002 47c86020 UNASSIGN/NULL 00200000 0000 0 0/2
0 000001 47c888b0 OPTIMAL/NULL 00200000 0005 2 0/1

1 100001 47c87468 UNASSIGN/NULL 00200000 0000 0 0/9
1 100000 47c89f48 OPTIMAL/NULL 01200200 0001 1 0/8
    
```

3.2.2.05 cfgUnit <volume>

This command displays detailed information about the volume.

-> **cfgUnit <volume>**

Displayed:	Explanation:
vd_unit = 2	VOLUME Number (SSID in decimal format)
vd_flags = 0003272f	VOLUME Flags (See following Table for values)
vd_suspendcnt = 0	Suspension count
vd_active = 0	Vd I/O count
vd_type = 7	VOLUME Type 3 = RAID 0, 4 = RAID 1, 5 = RAID 3, 7 = RAID 5
vd_pieces = 5	VOLUME Number of Pieces = Number of drives in VOLUME
vd_data_pieces= 4	VOLUME Number of Data Pieces. Doesn't include parity/mirror disk(s)
vd_cluster = 128	VOLUME Cluster Size = VOLUME Segment Size in blocks
vd_stripe = 512	vd data pieces x vd cluster
vd_piece = 187ccfb8	First piece address
vd_dev = 10000002	Virtual disk Major/Minor device number
vd_serialnum = 43bedf12	Timestamp when VOLUME was created
vd_timestamp = 43bedf0e	Timestamp of last update
vd_state = 0001	VOLUME State (See following Table for values)
vd_status = 0000	VOLUME Status (See following Table for values)
vd_new = 00000000	New configuration (reconfiguration)
vd_cfgFlags = 00010000	VOLUME Configuration Flags (See following Table for values)
vd_scrub_flags= 0	Data scrub flags (See following Table for values)

vd_capacity = 20971520	VOLUME capacity in blocks
vd_capacity2 = 20971520	Reconfiguration capacity
vd_boundary = 0	Restore/Copy/Reconfiguration boundary
vd_oos = 2	First piece number that is out of service (-1 = none)
vd_oos2 = -1	Second piece number that is out of service (-1 = none)
vd_ooscnt = 1	Number of pieces out of service
vd_op = 00000010	Exclusive operation (See following Table for values)
vd_cache_gran = 8	Cache Block Size (blocks)
vd_cache_blksize = 4096	Cache Block Size in Bytes (4K or 16K)
vd_pref_mgr = 1	Slot number of desired owning controller
vd_creation# = 6343	Incremental count of volume creation
vd_blocksize = 0200	Block size used
vd_edc = 0	Non-zero if EDC is used
vd_520B = 0	EDC size in bytes
vd_cmd_info = 00 00 60 0a 0b 80 00 11 15 46 00 00 63 43 43 70 e6 8c 00 00 00 00 00 00 00 00 00 00 00 00 00 00	World wide name of volume
vd_creation_serial# = 31 54 35 30 37 35 39 30 37 35 00 00 00 00 00 00	Serial number of controller that created the volume
User Label = Eng	User assigned name for the Volume
Pc	Piece Order listing of the VOLUME (similar to vdShow output)
Vp	Piece Pointer
vd_dev	Devnum of physical drive
vp_phydev	Pointer to the PhyDev
vp_dev	Drive identifier where piece is located
state	Piece State: 0x0000 = does not exist, 0x0001 = known to exist but not found, 0x0003 = in service, 0x0004 = out of service, 0x0005 = data/parity mismatch on piece(s), 0x0006 = being reconstructed
vp_spared = ffffffff	Devnum of drive currently sparing this piece
vp_org = 00000000	Pointer to original piece during reconfiguration

VOLUME State (vd_state)

These flags are bit values, and the following flags are valid:

0x0000	optimal
0x0001	degraded
0x0002	reconstructing
0x0003	formatting
0x0004	dead
0x0005	quiescent
0x0006	non-existent
0x0007	dead, awaiting format
0x0008	not spun up yet
0x0009	unconfigured
0x000a	LUN is in process of ADP93 upgrade
0x000b	Optimal state and reconfig
0x000c	Degraded state and reconfig
0x000d	Dead state and reconfig

VOLUME Status (vd_status)

These flags are bit values, and the following flags are valid:

0x0000	No sub-state/status available
0x0020	Parity scan in progress
0x0022	Copy operation in progress
0x0023	Restore operation in progress
0x0025	Host parity scan in progress
0x0044	Format in progress on virtual disk
0x0045	Replaced wrong drive
0x0046	Deferred error

VOLUME Flags (vd_flags)

These flags are bit values, and the following flags are valid:

0x00000001	Configured
0x00000002	Open

0x00000004	On-Line
0x00000008	Not Suspended
0x00000010	Resources available
0x00000020	Degraded
0x00000040	Spare piece - VOLUME has Global Hot Spare drive in use
0x00000080	RAID 1 ping-pong state
0x00000100	RAID 5 left asymmetric mapping
0x00000200	Write-back caching enabled
0x00000400	Read caching enabled
0x00000800	Suspension in progress while switching Global Hot Spare drive
0x00001000	Quiescence has been aborted or stopped
0x00010000	Prefetch enabled
0x00020000	Prefetch multiplier enabled
0x00040000	IAF not yet started, don't restart yet
0x00100000	Data scrubbing is enabled on this unit
0x00200000	Parity check is enabled on this unit
0x00400000	Reconstruction read failed
0x01000000	Reconstruction in progress
0x02000000	Data initialization in progress
0x04000000	Reconfiguration in progress
0x08000000	Global Hot Spare copy-back in progress
0x90000000	VOLUME halted; awaiting graceful termination of any reconstruction, verify, or copy-back

VOLUME Configuration Flags (vd_cfgFlags)

These flags are bit values, and the following flags are valid:

0x00000002	Disable auto replacement/reconstruction
0x00000000	Use default drive mode page values
0x00000100	Use current drive mode page values
0x00000200	Use saved drive mode page values
0x00010000	Mode pages are valid
0x00020000	VOLUME may use a Global Hot Spare Drive
0x80000000	Copy-back from Global Hot Spare drive is in progress

VOLUME Scrub Flags (vd_scrub_flags)

0x01	VD_SCRUB_HIGH_PRI	scrub at highest priority
0x02	VD_SCRUB_LOW_PRI	scrub at lowest priority
0x04	VD_SCRUB_BYTE_RATE	scrub rate is in bytes/s rather than blocks/s
0x10	VD_SCRUB_EXCL_HALTED	scrubbing halted on this lun by and exclusive op.
0x20	VD_SCRUB_IO_HALTED	scrubbing halted on this lun by quiescence
0x40	VD_SCRUB_DAC_COMPLETE	dacstore scrubbing finished on whole drive group

VOLUME Exclusive Operations Flags (vd_op)

4	MAX_OPS	total concurrent operations
7	NUM_OPS	number of operations managed
0x00000001	INTERRUPTED	
0x00000002	NEW	
0x00000010	DG_AVAILABLE	
0x00004000	VD_HOST_PARSCN	host requested parity scan
0x00008000	VD_PARITY_SCAN	parity scan needed
0x00800000	VD_IAF	an IAF reconstruction
0x01000000	VD_RESTORE	restore operation
0x02000000	VD_FORMAT	wipe operation
0x04000000	VD_RECONFIG	reconfig operation
0x08000000	VD_COPY	spare copy operation
0x0f80c000	OP_MASK	a mask of all pertinent operations in vd_flags
0xffffffff	NO_OP	used in cfgDebugCheckForIntOps and cfgDebugCheckForNewOps

3.2.2.06 **cfgUnitList**

This command displays a list on known volume(s) and state of the volume(s)
(4.x version)

```
-> cfgUnitList
The following LUNs exist:
LUN Number 0, state = 0
LUN Number 1, state = 0
LUN Number 2, state = 0
LUN Number 3, state = 0
LUN Number 4, state = 0
LUN Number 5, state = 2
LUN Number 6, state = 0
LUN Number 7, state = 0
LUN Number 8, state = 1
LUN Number 9, state = 0
LUN Number 10, state = 0
LUN Number 11, state = 0
```

(5.x & 6.x versions - see column breakdown below)

```
-> cfgUnitList
Vol#   vdUnit State/Stat vdFlags cfgFlags Pcs vdPiece Owner
  0 44d9f860 0000/0000 0023260f 00110000 4 44d9fa1c prim
  1 44da00e0 0000/0000 0023270f 00110000 4 44da029c alt
  2 44d9fb20 0000/0000 0053260f 00110000 4 44d9fcdc prim

1024 44d3720c 0000/0000 0000000f 00000000 2 44d373c8 alt
```

Vol # = Volume / Unit / SSID number of the unit **vdUnit** = Logical address of volume
State/Stat = State and status of the volume **vdFlags** = See cfgUnit – Volume Flags (vd_flags)
Pcs = Number of devices in the volume **Owner** = Owning controller of the volume
cfgFlags = See cfgUnit – Volume Configuration (vd_cfgFlags)
vdPiece = Virtual Disk Piece information in the controllers memory

3.2.2.07 **ghsList**

This command displays information about Global Hot Spare drives. State 3, status 0 indicates failed.
(4.x version)

```
-> ghslist
GHS ENTRY 0
  dev pointer=0x35c73a0
  devnum=300004
  state=2
  status=0
  flags=204000

```

3.2.2.08 vdAll <cmd>

This command will perform the *cmd* for all existing volumes, i.e. **vdAll vdShow**. (Requires Debug)

3.2.2.09 vdShow <volume>

This command displays detailed information about VOLUME configuration. When no number is given, volume 0 is assumed. (Requires Debug)

(4.x version)

```
-> vdShow 0
Virtual Disk Unit 0 Configuration
RAID5 5 pieces no spare 32 blocks/cluster 1331200 block capacity
512 bytes/block 128 blocks/stripe 8 blocks/cache block
Write-back mode. Auto Sync Age 600
    • Auto Sync Age is age at which write-back cache is eligible for writing to disk. Value in 1/60th of a second.
    • No Auto Sync" means cache is not eligible for writing to disk based on age.
activity indicator 0 - IDLE
    • Idle = no IOs in progress
    • Active = 1 or more IOs in progress
    • Quiesced = New IOs are suspended with no IOs in progress
    • Quiescing = New IOs are suspended with 1 or more IOs still in progress
ON-LINE OPEN OPTIMAL
    • Overall state is either on-line or off-line
    • Open state is either open or closed
    • Operational state is optimal, degraded (parity out-of-date), degraded (piece n out-of-service)
    • If IOs are temporarily suspended, then SUSPENDED will be displayed
Large IO limit = 1024 blocks Large IO buffers = 3
    • Large IO limit is the maximum transfer size to/from host. IOs greater than this limit will have multiple data transfers.
    • Large IO buffers is the number of rotating buffers for large IO requests.
Prefetch disabled. Minimum = 0 Maximum = 0 (blocks)
    Limit = 65535 Cutoff = 65535 (blocks)
    • Shows prefetch control information including amount of data to prefetch. If (multiplier) is shown, then the prefetch multiplier is enabled. Otherwise (blocks) is used for min/max amount.
Reconstruction Amount = 256 blocks delay = 0.1 seconds
    • Amount each reconstruction IO will reconstruct at a time. Delay between subsequent reconstruction IOs.
RESTORE in progress at block 0 with 0% complete.
    • Shown only if in exclusive operating state with percentage complete. States are: restore - piece reconstruction or parity creation; wipe - zeroing of all pieces; copy - piece reconstruction from a Global Hot Spare; reconfig - reconfiguring.

ADP Compatible Mapping (Left Asymmetric)
# dev offset length reads writes flags

piece4 00400000 0 332800 25579 29972 IN-SERVICE
    • Reads/writes - number accomplished on this piece.
    • flags - show the state of the piece. Valid states are in-service, out-of-date, out-of-service, restore non-existent, not-found, parity
```

```

Virtual Disk Unit 0 Statistics
      small      small      large      large      cache
      reads     writes    reads     writes    total    hits
requests  22136    21882      0         0        44018    261
  blocks  177074    175056      0         0       352130   2088
avg blocks    7         8         0         0         7         8
IO pct.    50.28%   49.71%    0.00%    0.00%   100.00%   0.59%
  • requests = the count of requests
  • blocks = the count of blocks requested.
  • avg blocks = average request size in blocks (blocks/requests)
  • IO pct. = percentage of requests vs. total requests
  • small reads = read and verify requests less than the Large IO size
  • small writes = write and write & verify requests less than the Large IO size
  • large reads = read and verify requests equal or greater than the Large IO size
  • large writes = write and write & verify requests equal or greater than the
    Large IO size
  • total = combined statistics for all reads/writes.
  • cache hits = statistics for small read requests of which the data for the
    entire request was found in cache.
  • If avg blocks is greater than 32, consider changing cache block size to 32.

      IOs      stripes      /IO      clusters      /IO
reads    21875    21875      1.00    21875      1.00
writes   21882    21882      1.00    21882      1.00
  • RAID 5 IO alignment statistics to be used for tuning.
  • IOs = count of requests
  • stripes = count of stripes accessed
  • /IO = average stripes accessed per request
  • clusters = count of clusters (segments) accessed
  • /IO = average clusters accessed per request

write    Full      Partial      RMW No Parity      RMW2      -
algorithms  10      1497      18367      0         0         0
  • Full = Full stripe write. May require a read if entire stripe not in cache.
  • Partial = More than one "data" drive needed to update the stripe
  • RMW (WB) = "traditional read-modify-write". Data was cached if WB enabled
  • RMW2 (WT) = "traditional read-modify-write". Data was NOT cached. Suspect FUA
    being set on writes if WB enabled. Ignore FUA with User Config Byte 26, bit 6
    = 1.

Repair attempts 0  Successes 0  Failed Reads 0  Failed Writes 0
  • Read error handling statistics
  • Repair attempts = No. of repairs attempted
  • Successes = data successfully reconstructed and rewritten
  • Failed reads = data not reconstructed nor rewritten
  • Failed writes = data successfully reconstructed but not successfully written
    (drive taken out-of-service).

RPA requests 78720  width 320335 avg. 4.06  depth 932308 avg. 11.84
RPA XOR statistics:
  • RPA Requests = count of RPA XOR requests
  • width = total number of buffers
  • avg. = average buffers per request
  • depth = total block length of all requests
  • avg = average block length per request

3.2.3 Drive/VOLUME Modify Commands

The **isp** means Independent Shell Process. It functions the same as using an ampersand (&) to run a program in the background in various Unix operating systems.

*** Note: The notation *devnum* is specified as 0xC0000I, where C is the 0-logical channel number, and I is the logical SCSI ID number.

*** Note: The commands listed below must be run from the owning controller.

3.2.3.01 **isp cfgPrepareDrive,0x<phydev>**

Spins the drive up but does not make the drive operational. Used for reading the DacStore of a drive.

*** Note: phyDev addresses must be used for this operation.

3.2.3.02 **isp cfgFailDrive,0x<devnum>**

This commands fails the drive specified by *devnum*.

3.2.3.03 **isp cfgReplaceDrive,0x<devnum>**

This command replaces the drive specified by *devnum*.

3.2.3.04 **isp cfgSetDevOper,0x<devnum>**

This command sets the drive status for drive specified by *devnum* to optimal with no reconstruct.

3.2.3.05 **isp cfgDelVdisk,<volume>**

***Caution: This command will delete the volume.

3.2.3.06 **isp cfgRefreshVdisk,<volume>,<devnum of optimal drive>,0**

This command will update the volume information on the alternate controller to match the current controller without a reboot.

3.2.3.05 **incrementCfgGenerationNumber**

This command will force an update of the“ObjectGraph” and the storage management client.

3.2.4 Controller/RDAC Status Commands

3.2.4.01 arrayPrint

This command can be used to determine detailed information of the operating dual controller mode.

arrayPrint Example on a Single Controller system

myValidState=1	0 = both controllers' state invalid 1 = both controllers' state valid
myDardacSwSupport=1	0 = no DARDAC support 1 = DARDAC support available
myRdacEnabled=1	0 = DARDAC feature disabled 1 = DARDAC feature enabled
myMode=0	0 = Active-Passive 1 = Dual-Active
myRdsUpdated=1	0 = RDACStore not yet updated 1 = RDACStore updated
myAltCtlReleaseWaitTime = 0x1e	Alternate Controller release wait time (in seconds)
myAltCtlReleaseWaitState = 0	Alternate Controller release wait state (True/False)
myAltCtlReleaseWaitDone = 3c99598	Semaphore Id for the job to notify Alternate Controller about release done

** Primary Controller **	
<i>This controller (Me)</i>	
myValidState=1	0 = State is invalid 1 = State is valid
myInitDone=1	0 = RDAC Manager not yet initialized 1 = RDAC Manager initialized
myRdsUpdated=1	0 = RDACStore not yet updated 1 = RDACStore updated
myMode=1	0 = Passive 1 = Active
myQuiesceState=0	0 = Normal 1 = Quiescence in progress 2 = Quiescent achieved
myForeignState=1	0 = Don't know 1 = Native controller 2 = Foreign Controller
myHighDriveSideScsiId=1	0 = Alternate is at higher drive-side SCSI ID 1 = I am at higher drive-side SCSI ID
myDriveSideScsiId=7	My drive-side SCSI ID
myHostScsiId=5	My host-side SCSI ID
mySwVersion=3 1 3	
myBoardSerialNumber=54 4e 23 30 30 30 31 54 34 32 37 31 30 30 34 33	TN#0001T42710043

3.2.4.02 arrayPrintSummary

This command prints a summary of array controller states and VOLUME ownership. It can be used to determine summary information about the dual controller mode of operation. Ensure that “controllers synchronized” is indicated. If not, the controllers won’t talk to one another. For Fibre Channel controllers see “fc 12”.

*** Note: To determine if logged into the A or B controller, look at the second line of the output. Locate “drive=”.

```

Drive Controller
7 A
6 B
    
```

arrayPrintSummary Example on a Single Controller System

```

-> arrayPrintSummary
04/26/05-02:16:04 (GMT) (tShell): NOTE: RDAC Mode is Active-Passive. Controllers
synchronized.
04/26/05-02:16:04 (GMT) (tShell): NOTE: Controller Mode Active. SCSI IDs (host 60, drive
6).
04/26/05-02:16:04 (GMT) (tShell): NOTE: 2 Volume Owned = {0,1}
04/26/05-02:16:04 (GMT) (tShell): NOTE: Alt. Ctrl. Mode Active (Absent/Not Failed). SCSI
IDs (host ff, drive ff).
04/26/05-02:16:04 (GMT) (tShell): NOTE: No Volume Owned
    
```

arrayPrintSummary Example on Dual-Active Controller System

```

-> arrayPrintSummary
04/26/05-02:16:04 (GMT) (tShell): NOTE: RDAC Mode is Dual-Active. Controllers
synchronized.
04/26/05-02:16:04 (GMT) (tShell): NOTE: Controller Mode Active. SCSI IDs (host 60, drive
6).
04/26/05-02:16:04 (GMT) (tShell): NOTE: 1 Volume Owned = {1}
04/26/05-02:16:04 (GMT) (tShell): NOTE: Alt. Ctrl. Mode Active (Present/Not Failed). SCSI
IDs (host 60, drive 7).
04/26/05-02:16:04 (GMT) (tShell): NOTE: 1 Volume Owned = {0}
    
```

arrayPrintSummary on Active/Passive Dual Controller System

```

-> arrayPrintSummary
04/26/05-02:16:04 (GMT) (tShell): NOTE: RDAC Mode is Active-Passive. Controllers
synchronized.
04/26/05-02:16:04 (GMT) (tShell): NOTE: Controller Mode Active. SCSI IDs (host 5, drive
6).
04/26/05-02:16:04 (GMT) (tShell): NOTE: 2 Volume Owned = {0,1}
04/26/05-02:16:04 (GMT) (tShell): NOTE: Alt. Ctrl. Mode Active (Present/Not Failed). SCSI
IDs (host4, drive 6).
04/26/05-02:16:04 (GMT) (tShell): NOTE: No Volume Owned
    
```

3.2.5 Controller/RDAC Modify Commands

3.2.5.01 `isp rdacMgrSetModeActivePassive`

This command sets the controller (that you are talking to) to active mode and the alternate controller mode to passive.

WARNING*** This command does not modify the controller cache setup, only the controller states. This may be accomplished by issuing the following command:

`isp ccmEventNotify,0x0f`

3.2.5.02 `isp rdacMgrSetModeDualActive`

This command sets both array controller modes to dual active.

WARNING*** This command does not modify the controller cache setup, only the controller states. This may be accomplished by issuing the following command:

`isp ccmEventNotify,0x0f`

3.2.5.03 `isp rdacMgrAltCtlFail`

Will fail the alternate controller and takes ownership of it's volumes.

NOTE: In order to fail a controller, it may be necessary to set the controller to a passive state first.

3.2.5.04 `isp rdacMgrAltCtlResetRelease`

Will release the alternate controller if it is being held in reset or failed.

3.2.5.05 `acsAutoCodeSync`

When a new (foreign) controller is inserted into a storage array, this command is automatically executed. This command will update the code level of the firmware, either up or down on revision level, to match the code level of the surviving controller. It is also possible to manually run this command from the controller that is to be updated.

3.2.5.06 `isp rdacMgrAltCtlReset`

This command will reboot the alternate controller.

3.2.6 Other Useful Shell Commands and Procedures

3.2.6.01 `cacheAnalyze`

Displays information about cache structures.

```
-> cacheAnalyze

3.2.7 netCfgShow and netCfgSet

These commands displays and set the networking information that the controllers use to communicate via the Ethernet port. These commands will need to be used if the arrays are not going to be managed by the Host/Agent in SANtricity. This will also permit shell access using an **rlogin** session. (A **telnet** session is NOT supported on ENGENIO controllers.)

Note: Some of the information about networking has been made obsolete as of 05.4x code. These changes will be indicated.

If a UNIX or DHCP BOOTP Server is not available on the network that a RAID Module is connected to, or static addressing is preferred, it is possible to configure the RAID Module’s network settings via the RS232 serial port(s) for the module. If a RAID Module contains two controllers, then each controller must have its network settings configured, including a unique IP Address, before the host RAID management software will work correctly.

The first step in manually configuring the network software on a controller is to make sure the controller is loading its network software. This software is loaded if the network option bit is set in NVSRAM. The network option bit is bit 3 in byte 0x28 of the User Configurable region of NVSRAM

You can determine if the network software has been loaded by typing **netCfgShow** at the controller shell prompt. If the return output states: undefined symbol: netCfgShow, then the network software has not been loaded.

If the network software has not been loaded, then the network option bit previously described should be turned on (set to one). This NVSRAM bit can be changed either via the controller Boot Operations Menu in the controller shell or by using a script in SANtricity. (**NOTE:** using the Boot Operations Menu to modify settings will affect I/O from the host, and should not be done with the host running I/O, file systems mounted, and/or active RDAC running on the host)

Once the network software has been successfully loaded, the network settings can be entered into the controller network configuration table via the **netCfgSet** command in the controller shell. To view the current network settings, enter **netCfgShow** at the controller shell command prompt. This will dump something similar to the following:

```
-> netCfgShow

==== NETWORK CONFIGURATION: ALL INTERFACES ====
Network Init Flags      : 0x00
Network Mgmt Timeout   : 30
Startup Script         :
Shell Password         :

==== NETWORK CONFIGURATION: dse0 ====
Interface Name         : dse0
My MAC Address         : 00:a0:b8:0c:c7:fa
My Host Name           : tslab020
My IP Address          : 172.22.192.20
Server Host Name      :
Server IP Address     : 0.0.0.0
Gateway IP Address    : 172.22.192.1
Subnet Mask           : 255.255.255.0
User Name              : guest
User Password         : *****
NFS Root Path         :
NFS Group ID Number   : 0
NFS User ID Number    : 0
```

To setup the controllers for Ethernet access run **netCfgSet** and answers the four questions indicated below. All other items can be skipped by simply pressing the Enter key.

```
-> netCfgSet

'.' = clear field; '-' = to previous field;
'+' = next interface; ^D = quit (keep changes)

==== NETWORK CONFIGURATION: ALL INTERFACES ====
Network Init Flags      : 0x00
Network Mgmt Timeout   : 30
Network Route #1       : dest=0.0.0.0
RAIDMGR Server #1     : 0.0.0.0
Network Manager #1    : 0.0.0.0
Startup Script         :
Shell Password         :

==== NETWORK CONFIGURATION: dse0 ====
My MAC Address         : 00:a0:b8:0c:c7:fa
My Host Name           : tslab020
My IP Address          : 172.22.192.20 ← The address of the controller.
Server Host Name      :
Server IP Address     : 0.0.0.0
Gateway IP Address    : 172.22.192.1 ← The gateway address (router, DNS server, etc.).

User Name              : guest
User Password         : *****
NFS Root Path         :
NFS Group ID Number   : 0
NFS User ID Number    : 0
```

The controller must have three of the above fields as non-default values in order to grant a management access to a controller. These fields are titled: My IP Address, Gateway IP Address, and Subnet Mask in the above table. In

In addition, some functional requirements require that the Network Init Flags be modified once a module has been successfully added to a RAID management station. For this reason, a table is included in the troubleshooting section of this document that lists those flags an end user might need to alter.

Descriptions of the three required fields are given below:

My IP Address

This field should contain the static IP Address that has been reserved on the network for the controller. Each controller in a dual controller RAID Module must have a unique static IP address reserved for it on the network.

Gateway IP Address

This field should contain the IP Address of the gateway for the subnetwork to which the RAID Module is connected. If there is no gateway on the subnetwork, e.g., a standalone network is being used or the RAID Manager Server is connected directly to the module via a crossover cable, then use the IP Address of the RAID Manager station in this field. This field cannot be left zeroed out or the network software may not work correctly.

Subnet Mask

This field should contain the subnet mask of the subnetwork to which the RAID Module is connected.

The values in the fields shown above can be modified via the **netCfgSet** command. This command will display each field listed in the **netCfgShow** output shown above, one field at a time. When each field is displayed, the cursor will be placed to the right of the current value waiting for user input. Entering a 'Carriage Return' at the cursor will cause the current field to be skipped with no changes being made to its value. Entering a period (.) at the prompt will cause the value of the current field to be reset to the factory default. A hyphen (-) in a field displays the previous parameter, an asterisk (*) in a field causes the default value to be used (which may be null), a plus (+) sign causes the set operation to skip to the next interface, and a control-D causes the function to terminate. Finally, to change the value of a field, simply enter the new value at the cursor.

IT IS STRONGLY RECOMMENDED that during an initial configuration that all values be set to their default values using an '*', except for the three required settings described in the preceding paragraph.

After the **netCfgSet** command has exited, a message should be displayed which states:

```
Network Configuration successfully written to NVSRAM.  
Reboot to use these changes.
```

The controller should now be rebooted by entering **sysReboot** at the controller shell prompt (**NOTE**: this command will affect I/O from the host, and should not be done with the host running I/O, file systems mounted, and/or RDAC actively running on the host). After the controller has finished its boot process, it should be able to **ping** the IP address of a RAID Manager station. The troubleshooting section of this document contains more detailed information on how to use the **ping** command in the controller shell.

When the **ping** command is running successfully, perform the previous steps on the other controller if the RAID Module contains dual controllers. Otherwise, refer to the section on troubleshooting in this document.

Network Init Flags

The Network Init Flags are used to control the initialization of the network interfaces of a controller. The one-byte field displayed next to the Network Init Flags title when the **netCfgSet** command is run, can be used to modify these flags. Each bit in this one-byte field corresponds to a flag. The function of each of these flags is listed below:

bit 0	=1: Do not use BOOTP for any reason	(Obsolete as of 05.4x)
	=0: Use BOOTP as needed	
bit 1	=1: Use BOOTP unconditionally	(Obsolete as of 05.4x)
	=0: Use BOOTP only as necessary	
bit 2	=0: Start NFS services	
	=1: Do not start NFS services	

bit 3	=0: Use "0.0.0.0" default route =1: Do not use "0.0.0.0" default route	
bit 4:	=0: Do not mount all NFS volumes =1: Mount all NFS volumes	
bit 5:	=0: Allow remote login to shell =1: Disable remote login to shell	(Obsolete as of 05.4x)
bit 6:	=0: Use remote access authorization =1: Do not require authorization	
bit 7:	=0: Enable NCF remote login =1: Disable NCF remote login	

Note: If the flags are set incorrectly but the IP gateway and subnet are not set then the controllers networking will revert to BOOTP.

The preceding bits can be hex-added in order to enable more than one flag. For example, a Network Init Flags value of 0x21 would set bits 5 and 0, disabling remote login to the shell and causing the controller software to not broadcast to a BOOTP server.

While all of the flags available in the network software are listed in the above table, the only flags which the end user should ever need to modify are 0x01, 0x02, and 0x20. If the controller network interface is being manually configured via the controller shell, then bit 0 should be set to 1. Changes to any of these flags can lead to network connection problems.

The 0x20 flag can be used for added protection if network security is an issue. If this flag is not set, then anyone can access the controller shell if they know the IP address of a controller, and the controller shell password. On the other hand, leaving this flag unset can be useful for debugging purposes since it enables access to a controller shell via **rlogin**.

3.2.7.1 Troubleshooting

3.2.7.1.1 Testing a Network Connection

The **ping** command is used to test whether a particular system is accessible over the network. The **ping** may be issued from the controller to reference itself, another Series 3 controller or any other system on the network. **ping** sends one or more ICMP packets to the specified system and waits for a response. Because ICMP protocol packets can traverse networks, the **ping** command is useful for testing the routing tables and internetwork connectivity.

The **ping** command has three parameters, the first is the double-quoted host name or quoted IP address of the target, and the second is the number of times to receive valid responses to pinging packets. If the second parameter is not specified, **ping** continues until a control-C is entered on the keyboard or until 5 failures to receive responses. **CAUTION:** there have been instances where <Control-C> has not succeed in 'killing' the **ping** command. In extreme cases, it has even been necessary to reboot or power-cycle the controller to regain serial access to the controller. Thus, IT IS STRONGLY RECOMMENDED that the second parameter in the **ping** command be used.

If 1 is specified for the ping count, **ping** displays either "no answer" or "... is alive", as in the following examples:

```
ping "53.79.14.48",1
no answer from 53.0.0.123
```

```
ping "53.79.14.48",1
53.79.14.48 is alive
```

When more than one ping packet is issued, **ping** displays detailed information about each packet as well as summary statistics. The following example issues 5 packets to the remote system with IP address 53.0.0.123 (the IP address output by the **ping** is reversed):

```
ping "53.0.0.123", 5
PING elvis (53.0.0.123): 56 data bytes
64 bytes from 123.0.0.53: icmp_seq=0, time=176. ms
```

```
64 bytes from 123.0.0.53: icmp_seq=1, time=0. ms
64 bytes from 123.0.0.53: icmp_seq=2, time=64. ms
64 bytes from 123.0.0.53: icmp_seq=5, time=64. ms
64 bytes from 123.0.0.53: icmp_seq=6, time=80. ms

----53.0.0.53 PING Statistics----
7 packets transmitted, 5 packets received, 28% packet loss
round-trip (ms) min/avg/max = 0/76/176
```

The third parameter, ordinarily not specified, controls the action of the pinging. If bit 0 is set in the third parameter, **ping** suppresses displayed output, the resulting value of **ping** indicates the success of the **ping** operation. If bit 1 is set, pinging is limited to the local network; packets will not be forwarded through the gateway. If bit 2 is set, then information about packets without responses is also displayed.

If the output which results from running the **ping** command states: ‘no answer from...,’ either something is not configured correctly, or there is a hardware problem. Try the **netCfgSet** command again and verify the settings listed above. If after this change, the desired RAID Manager station still cannot be ‘pinged’, check that one of the following pitfalls has not occurred:

- No gateway address included
- Improper subnet mask
- Network Init Flags set improperly (See section below)

If the controller still cannot **ping** the RAID Manager Server, first check the “**Troubleshooting Section**” below, and then the remaining items in this section.

3.2.7.1.2 Network Statistics

VxNet provides detailed statistics for most network components. This data can be quite useful in isolating network problems. All of the statistics for these components may be dumped to the console using the one **netShow** command, or data for individual components may be shown with their respective "show" functions:

Component	Show Command	UNIX Counterpart
ELC Ethernet Driver	elcShow	xxxstat (where xxx is the name of the network driver)
ENE Ethernet Driver	eneShow	xxxstat
Network Interface control	ifShow	ifconfig -a
ICMP	icmpstatShow	netstat -s
UDP	udpstatShow	netstat -s
IP	ipstatShow	netstat -s
TCP	tcpstatShow	netstat -s
Routing	routestatShow	netstat -r -s
Port mapping	inetstatShow	netstat

With respect to isolating a network problem, some of the more important statistics found from these commands are:

Command	Statistic	If ...	Consider ...
ifShow	Subnetmask	The subnet mask does not match that defined by the network administrator for the network	Change the subnet mask parameter in the Network Configuration
eneShow or elcShow	recv interrupts	Zero interrupts	Check the Ethernet cable, AIU connector, etc. A physical problem is evident.
	xmit interrupts	Zero interrupts	Check the physical connection. The Ethernet chip on the controller may be faulty.
	r-error	Nonzero error count	Examine the other error statistics (collisions, crcs, aligns, missed, etc.) These will indicate a physical connection problem, or another device is on the network is misbehaving.

Command	Statistic	If ...	Consider ...
	t-error	Nonzero error count	Examine the other statistics.
	recv drops, collisions	Large count relative to "r-no-error" (> 10%)	The network is straining under excessive load, but is still working.
udpstatS how	Bad data length	nonzero	Internal software failure
	Bad checksum	nonzero	Internal software failure

3.2.7.2 Common Network Problems

A common problem with network configurations is where two network devices have the same IP address (someone did not enter the correct values in **netCfgSet**). Unfortunately, this situation is also quite difficult to diagnose. Some symptoms of the duplicate IP address problem are:

A functioning networked computer stops responding, or responses are not as expected, when another network device is started.

An **rlogin** session or file access activity is terminated without an apparent reason.

rlogin into a system or controller shows the wrong system or controller name.

To attempt to discover this problem, on some of the network nodes use the UNIX **arp -a** command or the VxNet **arptabShow** command to list the IP address to physical address associations. Examine the data for any discrepancies (all controllers must have the 00:A0:B8 value in the physical address).

To correct the problem, first change the IP address on the offending system or turn off that system. Then flush the ARP tables in each node. For some systems that do not have an ARP flush capability, they may need to be reset to clear out the bogus association. Another method that might be tried is to restart the offending system after its IP address has been changed, and then attempt to ping it from all of the other nodes, thereby forcing corrections to the ARP tables on each system.

3.2.8 writeZerosFlag

This command can be used to repair or rebuild part or all of the DacStore region without affecting the user data on the disks.

3.2.8.01 Turning writeZerosFlag On

By turning on the **writeZerosFlag**, any changes to the dacstore region will prevent writing zero's (restripping) the data area.

The first part of this procedure, **VKI_EDIT_OPTIONS**, works like an rc script in Unix or an autorun in Windows. In the event the controller reboots while trying to repair the DacStore, this will automatically load to protect the data area.

***NOTE: On dual controller systems you must perform these procedures on both controllers.

-> **VKI_EDIT_OPTIONS** ← Type command, press <ENTER>

EDIT APPLICATION SCRIPTS (disabled)

Enter 'I' to insert statement; 'D' to delete statement;

'C' to clear all options; '+' to enable debug options; 'Q' to quit **I** ← Type "I" and press <ENTER>

Enter statements to insert (exit insert mode with newline only):

writeZerosFlag=1

← Type command, press <ENTER>

← Press <ENTER> again

EDIT APPLICATION SCRIPTS (disabled)

1) writeZerosFlag=1

Enter 'I' to insert statement; 'D' to delete statement;
'C' to clear all options; '+' to enable debug options; 'Q' to quit + **← Type a Plus sign and press <ENTER>**

EDIT APPLICATION SCRIPTS (enabled)

1) writeZerosFlag=1

Enter 'I' to insert statement; 'D' to delete statement;
'C' to clear all options; '+' to enable debug options; 'Q' to quit **q ← Type “Q” and press <ENTER>**
Commit changes to NVSRAM? (y/n) **y ← Type “y” and press <ENTER>**
value = 12589824 = 0xc01b00

The second part of this procedure is actually issuing the **writeZerosFlag** command itself. By running the command from the shell it is not necessary to reboot the controllers in order for the flag to be turned on.

-> **writeZerosFlag=1** **← Type command, press <ENTER>**

It is recommended that you do this last step to ensure that the **writeZerosFlag** is properly set.

-> **writeZerosFlag** **← Type command, press <ENTER>**

Make sure that the value that is returned matches what you entered, in this case a value of 1.

3.2.8.02 Turning writeZerosFlag Off

Use this procedure to turn the **writeZerosFlag** off so that normal functionality is restored, in other words to allow writing zero's to data area.

-> **VKI_EDIT_OPTIONS** **← Type command, press <ENTER>**

EDIT APPLICATION SCRIPTS (enabled)

1) writeZerosFlag=1

Enter 'I' to insert statement; 'D' to delete statement;
'C' to clear all options; '-' to disable debug options; 'Q' to quit **C ← Type “C” and press <ENTER>**
Clear all options? (y/n) **y ← Type “y” and press <ENTER>**

EDIT APPLICATION SCRIPTS (enabled)

Enter 'I' to insert statement; 'D' to delete statement;
'C' to clear all options; '-' to disable debug options; 'Q' to quit - **← Type Minus sign and press <ENTER>**

EDIT APPLICATION SCRIPTS (disabled)

Enter 'I' to insert statement; 'D' to delete statement;
'C' to clear all options; '+' to enable debug options; 'Q' to quit **Q ← Type “Q” and press <ENTER>**

Commit changes to NVSRAM? (y/n) **y ← Type “y” and press <ENTER>**
value = 12589824 = 0xc01b00

-> **writeZerosFlag=0** ← Type command, press <ENTER>

It is recommended that you do this last step to ensure that the **writeZerosFlag** is properly set.

-> **writeZerosFlag** ← Type command, press <ENTER>

Make sure that the value that is returned matches what you entered, in this case a value of 0.

3.2.9 Reviving a Dead Volume

1. Determine the order of failure of the drives. There are several different ways to determine the order of drive failures. For best results use two of the three to confirm order.
 - **cfgPbDev**
 - Check the state of the volume (vd_state) as seen by each failed drive. The drive that shows a different state than the, i.e. volume optimal vs. volume degraded is the first failed drive.
 - If the drive's last view of the LUN was an optimal LUN, then it was the first to fail. The second drive to fail would show a state and status of degraded. All subsequent failing drives will show a dead LUN state and status.
 - **cfgPh**
 - Look for the drive update time stamp of each of the failed drives.
 - Check the Major Event Log
 - Remember that these drive locations are physical not logical.
 - *** Caution: if drive failures occur close together, then the MEL may not be reliable.
 - Do Not use "oos" from **cfgUnit**
 - "oos" means Out Of Service
 - The "oos" order may not reflect the order that the drives failed.
2. Fail any hot spares that are not in use. This is to prevent unwanted reconstruction to the hot spares during repair.
3. Spin up all failed drives to check for fail order
 - **isp cfgPrepareDrive,0x<phyDev Address>**
 - **isp cfgPrepareDrive,0x4cdd468** (the leading 0 in the address can be dropped)
4. Revive all but the first failed drive(s).
 - **isp cfgSetDevOper,0xc0000i**
 - c = channel i = ID
5. Reconstruct the first failed drive last.
 - **isp cfgReplaceDrive,0xc0000i**
 - or
 - Remove the first failed drive, wait 60 seconds, then reinsert drive. This will power cycle the drive plus perform the **cfgPrepareDrive** & **cfgReplaceDrive** commands automatically.
6. Revive the hot spares once reconstruction has begun.

3.2.10 Deleting a Host Port from the Shell

Symptoms

Host port does not show up in available host ports list in SANtricity
Cannot map a host port

Fix

```
-> spmShow
SPM controllerRef=070000000000000000000001 ssidMax=129 lunMax=10
SAP SAPORT_REF CONTROLLER_REF PORT SAPTRGRP_REF (0x3e3b5a8)
SAP 800300010000 0700000000000000000000002 0 000000000000
SAP 800300011000 0700000000000000000000001 0 000000000000
HP HOSTPORT_REF TYPE NAME LABEL HOST_REF (0x3e35c44)
```

```
HP 820300020000 2 0x20000001738119BA fcaw1-20 840300020000 HostControlled
HP 820300020001 2 0x20000001730119BA fcaw0-20 840300020000 HostControlled
HP 820300030006 2 0x200000017301199A hbaA_17 000000000000
HP 820300030007 2 0x20000001730119AE hba0-17 840300030005 HostControlled
```

To delete the host port of label hbaA-17 run the command:

```
-> deleteHostPort_MT 0x00030006
```

where 0x00030006 is the host hostport_ref value that you want to delete. The "0x00030006" above is the rightmost 8 digits of the hostportref value for the hostport to be deleted.

Note

The controller has a mapping for this host port that does not show up in SANtricity.

3.2.11 Volume is not accessible from the host

Facts

Array and volumes are all optimal.
No pieces are out of service.
State and status of LUN are optimal.
vd_oos = -1
vd_oos2 = -1
vd_ooscnt = 0
All drives must be Optimal/Null

Symptoms

Volume is not accessible from the host.
vdShow lists volume as 'offline closed suspended'

Fix

From the shell prompt, type the following command:

```
-> cfgConfigVdisk X
```

Where X is the LUN number that will be changed back to 'online open optimal'.

3.2.12 Drive path redundancy lost

Fact

It may be possible to recover the path by running a command to poll the chip for the path that is failed
Notice that the path that is failed above is 1

Symptom

You may see something like this output from fcDevs 4:
Disk 00a00009 5,1 a7 Cur:0 Fail:1
Disk 00a0000a 5,2 a6 Cur:0 Fail:1
Disk 00a0000b 5,3 a5 Cur:0 Fail:1
Disk 00a0000c 5,4 a3 Cur:0 Fail:1
Disk 00a0000d 5,5 9f Cur:0 Alt:1

Fix

```
-> fcChip=x
where x = the chip relating to the path that is failed, i.e. 1 in the above example (Sets this as the active chip)
-> fcSendPrim 5
5 is the option to poll the path
```

Note

This may not always work, but is an easy solution to try first.

3.2.13 How to retrieve the Major Event Log (MEL) from the shell

To display a summary of all MEL event entries:

```
-> showMajorEvents -1,-1,0
current 0x1621 critical 0x1611 max 0x2000 timeStamp 40e1e484 start 0x0 0x0

      Event          Seq Num    id          time          dev    lun
      .
      .
2117 CCM_ERR_CLEARE 000003eb 0048210a 02/17/04 15:30:30 00000000 0
2114 ALT_CACHE_BATT 000003ec 00000000 02/17/04 15:30:30 00000000 0
2024 SCRUB_RESUME   000003ed 00000000 02/17/04 15:31:33 10000001 1
      .
      .
0000 Unknown Event 00000000 00000000 01/01/70 00:00:00 00000000 0
```

To display a specific event or group of events starting at a given point with more detail:

```
-> showMajorEvents 1004,1,4
current 0x1621 critical 0x1611 max 0x2000 timeStamp 40e1e484 start 0x0 0x0

      Event          Seq Num    id          time          dev    lun org ctl evd len
00492114 ALT_CACHE_BATT_ 000003ec 00000000 02/17/04 15:30:30 00000000 0 00 1 00 0
```

In the above example, the commands first parameter is the event sequence number expressed in decimal format (not hex as in the example to display all events). The second parameter is how many events are to be listed, including the beginning event. The last parameter is setting the level of detail. Usually the number that should be used is four (4).

3.2.14 Adding drives that have a previous DacStor on them

There are three different methods to allow adding drives that have a previous DacStor on them so that this information does not create a condition known as “dirty DacStor” from occurring.

Method #1

```
-> isp cfgWipe1,0xc0000i ( this would be for a drive at c,i)
-> isp rdacMgrAltCtlReset (this will do a quick reboot of the alternate controller)
-> reboot (this will do a quick reboot of the controller currently logged into)
```

Now look at the drive in **cfgPhy c,i** it should be:

```
d_state=2
d_status=0
```

If the drive is to be moved from one storage array system to a different one, then the two reboots are not required as the drive will see the insertion into the foreign array the same as if the controllers had been rebooted.

Method #2

Disable Drive Migration by turning on bit 1 in Offset 35 of the Global NVSRAM region. This can be done using the Script Editor using the following script:

```
// Turn drive migration off by setting bit 1 offset 0x35
set controller[a] Globalnvsrambyte[0x35]=0x02,0x02;
set controller[b] Globalnvsrambyte[0x35]=0x02,0x02;
show controller[a] Globalnvsrambyte[0x35];
show controller[b] Globalnvsrambyte[0x35];
show "Drive migration is now disabled.";

// Reboot controllers one at a time for NVSRAM changes to take effect
show "Rebooting A controller.";
```

```

reset controller[a];
show "A controller has rebooted.";
show "Rebooting B controller.";
reset controller[b];
show "B controller has rebooted.";

```

By disabling the drive migration feature, any drive that is inserted into a slot that the drive did not previously occupy will cause the array to write new DacStor to the drive. This would include not only foreign drives, but also drives from the same array that had been in a previously different slot so caution is advised.

Method #3

Using the Global Hot Spare slot will also clear DacStor

3.2.15 Changing the modification priority

Establish a shell connection to the controller that owns the lun/volume. At the prompt type:

```
-> isp cfgSetReconParams,x,0xffff
```

X=lun to be reconstructed

ffff= 100%

bfff=75% (This is the default value in the GUI)

7fff=50%

3fff=25%

NOTE: While the value is set to ffff, any storage system access will be impacted. After the reconstruction/modification is complete, the default value will have to be reset using the same command with the default value of bfff or lower.

3.2.16 How to identify a drive from the shell

*** Note: These commands use *id,ch* not *ch,id* as most commands are.

To identify a drive use the following command:

```
-> setDriveIdentify id,ch
```

This will flash the fault light on the drive in question.

To turn the light off.

```
-> resetDriveIdentify id,ch
```

3.2.17 How to create and delete a Global Hot Spare from the shell

Create Hot Spare

```
-> isp cfgMarkDriveHotSpare,0xc0000i,0
```

Remove Hot Spare

```
-> isp cfgRemoveHotSpare,0xc0000i,0
```

3.2.18 Monitoring and Stopping Media Scan from the shell

Use the **mon** command to determine the progress of any media scans that are currently running. This command can only be stopped with a **CTRL-C**. The middle parameter represents the intervals in seconds between each reading taken.

```

-> mon 7,10,1
Monitoring Virtual Disk Background Operations at 10 second intervals
20:50:23
  Scrub    0    96% | Scrub    1    5% | Scrub    2    96% | Scrub    3    17%
  block 2822283264 | block 210599936 | block 1885282304 | block 170801152

```

This command must be run from the owning controller.

```
-> getVolumeActionProgress_MT 0
Percent Complete           : 96
Estimated Time to Completion: -1
```

To stop all media scans.

```
-> setSAMediaScanPeriod_MT 0
```

To stop media scan on a specific volume.

```
-> setVolumeMediaScanParams_MT <vol#>,0,0
```

*** Note: Stopping a media scan either from the shell or in the Array Management software will not stop media scans instantly. The media scans will continue until completed. Stopping media scan only prevents the queuing up of any additional scans of the data region. Only used areas of drives are scanned, unused (unconfigured space) is not scanned nor are Global Hot Spares that are currently unassigned. Media scans of the DacStor region of all disks will continue and cannot be stopped.

3.2.19 hdd 90

This command is the same as using the **fcAll 90** plus this clears the hdd statistics. **Note:** This command, like all of the other hdd commands does not exist as of 6.16 firmware code.

3.2.20 Turning tracing on and repairing bad blocks

Turning Trace On and Off

```
-> eelPrintfs=1 (pre 05.40)
-> eelPrintfs 1 (05.40 and later)
-> dstEnablePrintDriveSense=1 (for SCSI)
-> hddEnablePrintDriveSense=1 (for Fibre)
```

* NOTE: To turn off the above commands replace the one (1) with a zero (0)

Repairing a bad block - Prior to 05.30.05 code. The following is the procedure to reassign a bad block. (Shell procedure in **RED** comments in **BLUE**). For this example we are using LBA **0x01181359** and devnum **0x200000**.

```
-> VKI_KMZALLOC 220
value= = 0xa2654214 (This is the 1st memory address)
```

This will return a hex value called a CDB. (Example 0x01181359) Using the above value enter:

```
-> m 0xa2654214,1 (Here we modify the 1st memory address)
a2654214: 00-07
a2654215: 00-.
```

```
value = 1 = 0x1
```

```
-> VKI_KMZALLOC 200
value = 0xa26291e4 (This is the 2nd memory address)
```

```
-> m 0xa26291e4,1 (Here we modify the 2nd memory address)
```

```
a26291e4: 00-00
a26291e5: 00-00
a26291e6: 00-00
a26291e7: 00-04
a26291e8: 00-01 (The next 4 bytes here contain the LBA: 0x01181359)
a26291e9: 00-18
```

a26291fa: 00-13
a26291fb: 00-59
a26291fc: 00-

value = 1 = 0x1

(The format of this command is 'dstDebugExecCDB devnum,1st_memory,2,2nd_memory,8,0').
-> dstDebugExecCDB 0x200000,0xa2654214,2,0xa26291e4,8,0

Dev:00200000 CDB:070000000000000000000000 dataBuf:a26291e4 stat=0
value = 31 = 0x1f (should display a non-negative value if it succeeded.)

dstDebugExecCDB

drive devnum, 0x200000
CDB pointer 0xa2654214
direction (2=write, 3=read),
buffer pointer CDB+12 (0xa26291e4)
buffer length (this must match the value in the above example this is in bytes) 8
display (0=no display, 1=display) 0

***** WARNING: Care must be taken when using this procedure as controller memory locations are being changed. If care is not taken, serious problems could arise. Use this procedure only under supervision of someone that has been trained and is adept in this process. Do NOT attempt this procedure if you have never done this before.**

Repairing a bad block - after 05.30.05 code

-> **vdReconFixURE=1**

To turn off the above command replace the one (1) with a zero (0)

*** Note: This command will not work for 05.36 and 05.37

*** Note: This is built into the firmware and is enabled automatically as of 06.xx code and later.

3.2.21 Clearing the Storage Partition Management Region

To clear the Storage Partition Management (SPM) region

-> **isp spmClearDatabase**

This will clear all mappings, host ports, hosts and host groups.

4. Fibre Channel Driver Commands

All the commands from the previous section can be used for the Fibre Channel Controllers.

This portion of the debug guide contains commands that are only useful for the Fibre Channel controllers utilizing the Shell Command interface on ENGENIO Series 4 Fibre Channel RAID Controllers.

4.1 Overview

4.1.1 Cables

Anyone handling the optic cables needs to be aware that the glass fibers inside the insulation are brittle and susceptible to handling damage. When handling these cables, do not bend them or pinch them. The recommended handling method is to coil the cables in a circle with a diameter of 4" or greater. Please insure that you handle, store, and install these cables within this guideline.

4.1.2 Watchdog Timer

The watchdog timer is enabled for fibre channel because there is no equivalent of a scsi-bus-reset. The watchdog timer will reset the controller if there is no fibre channel interrupt serviced for about 5-10 seconds. The array controller generates its own interrupts to cover times when the host is inactive. You can check if the watchdog is enabled by invoking: "fc 5"

4.2 Debugging Problems with the Fibre Channel Interface

POWER

- Is everything powered on (hosts, targets, hubs, switches, etc)? If the controller won't boot and you've got many lights on and some flashing, ensure that your power is good. Sometimes the 3622 will boot by itself, or the 3622/81E will boot by themselves, but when the GLM is added, the power dips down to where the controller will not boot.

CABLES

- Ensure that all cables are attached. The "transmit port" of each device must be connected to the "receive port" of the next device. Normally (looking down the barrel of the connector) the "receive port" of a GLM is on the left, and the "transmit port" is on the right (if a copper GLM, longer edge of D-shell on top; if an optical GLM, keyed side on the bottom).

- There should be no sharp bends in the cable, the optics cable may be broken.

SOFTWARE

- Ensure that the drivers are loaded on both the host and target (array). If the driver is loaded on the array, the "fc" command will work.

CONTROLLER HARDWARE

ETHERNET (IP) ADDRESS ON CONTROLLER

- Ensure that the Ethernet address has been set on the controller (this should have been done at the factory). You can check "fc 1" for a WWN (World-Wide-Number) of "1000 0000 -0000 0000" (which means it's not set), or check the "bootMenu" network option or run "netCfgSet" from the shell, checking for "My MAC adrs = 0" (which means it's not set). The array will not attempt to go online without a valid WWN.

IF ARRAY IS ATTACHED TO A HUB (loop)

- Look at "fc 20", and see which device issued a "link failure LIP" (designated at "LIPF ALPA"). Normally the device upstream from it (i.e., the device just prior to it on the hub) has failed. Data travels in different directions depending on which hub you are using.

- Second option: Start unplugging devices until the loop comes up.

IF ARRAY IS CONNECTED TO A LOOP

POWER CYCLE EVERYTHING

- a. Power cycle the hub
- b. Power cycle all devices at the same time

CHECK THE DATA PATH ON ANY ARRAY WHICH YOU SUSPECT MAY BE BAD

IF LINK IS UP, SEE WHICH DEVICES YOU CAN TALK TO

Warning* Only do this when the system is quiescent, as it may cause things to hang!**

- **sendEchoAll** (sends Echo to every AL_PA on loop)

IF YOU SUSPECT COMPONENT PROBLEMS (GLM/GBIC), CHECK BIT-ERROR STATISTICS

IF ALL ELSE FAILS

- Call ENGENIO analysts. Our fast and friendly staff will be glad to help you. Be prepared to take a trace (“setSfcTrace 1,-1” and “fc 99”).

4.3 The fc commands

The **fc** commands are used to diagnose a fibre channel interface. To show information on all channels at one, use the command **fcAll** followed by the number of the **fc** command requested (see section 4.3.1.17).

fcChip=<channel #>

Used to set a controller software variable to a specific value for debug purposes. Determines which internal fibre loop channel that will be displaying information for the **fc** commands (viewed from which chip in the controller). To select the channel for an **fc** command, use the **fcChip** command.

```
-> fcChip=4
fcChip = 0x7ed5768: value = 4 = 0x4
```

To determine which channel is currently selected, use the **fcChip** command without a channel number. In the example below the value is channel two (2).

```
-> fcChip
fcChip = 0xa15cff30: value = 2 = 0x2
```

4.3.1 fc <Usage>

(4.x version)

```
-> fc

(Tick 0021143519) ==> 04/08/02-16:31:56 (GMT)

4.3.1.01 fc 2 (Fibre Channel History)

Statistics kept on Fibre Activity: ****Note that “fc 90” will clear these counts back to zero.**
 Total commands should increment every time you enter "fc 2". If not, someone's stuck or the system is inactive.
 Statistical counts are displayed only if they are non-zero. The first section represents a count of the various types of SCSI commands received. The “RetStat” section represents a breakdown of the various types of SCSI check conditions returned. The “IsrStat” section represents a count of each type of Tachyon interrupt the Controller processed. The “FrmSent” section represents a count of each of the types of frames the Controller sent. The “FrmRecv” section represents a count of each of the types of frames the Controller received. The “Misc” section represents miscellaneous counts. There are many other counts you will receive, some of which are documented here.

```
-> fc 2

fc 2 CHIP: 0 Dst chan: 0 (Tick 0275934835) ==> 07/21/36-16:36:41 (GMT)

	(HdReset	1)	(SelfChk	2)	(XidScan	436221)
LipReas==>	(ChipRst	1)				

 This list identifies how many of each different type of SCSI command have been received.

RetStat -- These are counts of the SCSI return statuses categorized by sense key:

CHECK CONDITIONS

- (1) Recov – Recovered errors
- (2) NotRdy – Not Ready errors
- (3) Media – Media errors
- (4) HwErr – Hardware errors
- (5) Illreq – Illegal requests
- (6) UA – Unit Attentions
- (b) AbtCmd – Aborted commands
- (e) MisCpr – Mismatches
- () LnkErr – Link errors (sense key is 0x0b asc 0x47 ascq 0x00)
- () Passiv -- Passive lun status (sense key is 0x05 asc 0x94 ascq 0x01)
- () AltRst -- Alternate controller reset (sense key 0x06 asc 0x95 ascq 0x02)

RESERVATION CONFLICTS

RsvCnf -- Reservation conflicts

QUEUE FULLS

Qfull – Queue fulls

OTHER ERRORS

Other -- Other errors

IsrStat -- These are counts of the Tachyon inbound queue entry types

OutCmp -- Outbound completions

OutCmpH -- Hi priority outbound completions

InMfSeq – Inbound multi-frame sequences

OooFrm -- Out of order sequences (rare)

InSfSeq – Inbound single-frame sequences

Cls1TO – Class 1 timeout (should never see)

SfWarn – Single frame buffer queue warnings

MfWarn – Multi frame buffer queue warnings

ImqWarn – Inbound message queue warnings

RdStat – Read status requests (increment while idle)

InData – Inbound data completions

InCmnd – Inbound commands

BadScsi – Bad Scsi frames (these may or may not be bad)

InStat – Inbound SCSI statuses (should never see in target mode)

BadScsi -- These are the classifications of why a frame is declared “badScsi”

ScsData – SCSI data (normally for Mode Select or Write Buffer) (normal)

Discard – Frame was discarded (this is an error condition)

BadRxid – Frame’s RXID was invalid (this is an error condition)

Logo – Logout frame was received (this is OK)

Status – Frame was a SCSI status frame (OK in initiator mode; rare for target mode)

Misrout – Frame was sent to another port, but was received by us (error condition)

FmStat – These are counts of Frame Manager statuses.

LnkDwn – Link Down

LnkUp – Link Up

LnkFail – Link Failure

LIPF – Link Failure Lip received (LIP-F8)

NosOls – NOS or OLS primitive received

Elastic – Elastic store error

NonPart – Non participating on loop

CredErr – BB credit error

FlogReq – Flogi required

BadAlpa – Bad ALPA on frame we sent

Troubleshooting and Technical Reference Guide - Volume 1

ArbTO – Arbitration timeout on frame we sent

FrmSent (Frames we sent)

FrmRecv (Frames we received)

These are frame counts. They normally do not include SCSI frames, however.

The mnemonics are self-explanatory to someone who is familiar with fibre channel.

OXR – These are counts of the types of outbound exchange recovery that we did.

PrgErr – Programming error (indicates a driver bug)

RtyExc – Retries exceeded

Reject – Prjt or Frjt received

FrmTO – Frame timeouts

AckTO – Ack timeouts

AbtReq – Abort requested in the F_CTL of the header

LnkDwn – Link down during frame transmission

ClErr – Class 1 error

Misc -- These are counts of miscellaneous events of interest

Online – Number of times we sent LIP

LipF7 -- Number of times we sent LIP-F7

HstCtl – Number of times we went into Host Control mode

Offline – Number of times we went offline

Flush – Number of sequences we flushed

EarlyFr – Early free of exchange (common on ABTS)

Qdepth – Maximum queue depth observed

DlenMM—Data length mismatch (indicates host error on data transfer)

InvLun – Invalid lun field in FCP-CMND frame (indicates host error)

OcqWait – Number of times OCQ was full, and we had frames waiting to be sent

BlkFifo – Blocked outbound fifo

ParErr – Parity error (this is a very critical error, indicating a bad Tachyon)

MWrtTag – Number of write commands tagged as being slow to finish

Ignore – Frames ignored due to SOFF or “waiting for FAN”

RatovTO – Response timeouts due to RATO time expiring

LsRjtTO – Response timeouts due to LS-RJT received

WdogChk – Number of times watchdog idle check was made

LdwnObs – Number of “link downs” we observed.....ie we did not cause them

Misrout – Number of misrouted frames received (ones not addressed to us)

LnkRst – Number of times we sent LINK-RESET

HdReset – Number of times we initiated a hard reset of Tachyon

ElasAct – Number of times we took action to curb a flood of elastic store errors

SelfChk – Number of times we sent a “self check ECHO” to ensure BB-credit

Fatal-E – Number of fatal errors (you should never see this since we’ll reboot)

HiPri – Number of hi-priority frames we sent

Stuck – Number of times link was stuck in a failed condition more more than a second.

MwrtErr – Number of writes aborted with “link errors” due to not receiving host data

HpShort – Number of times we were out of Hi priority structures (normally a problem)

ImqFull – Number of times IMQ was full when our idle timer expired

ImqSvc – Number of times timer serviced IMQ, instead of interrupt doing it (should not see this)

Logout – These are reasons why we logged out a port.

Unk – Unknown

Prjt – Logout due to PRJT received

PortRtry – Logout due to port retry failure (we could not talk to this port)

Logo – Logout due to LOGO frame received

Prlo – Logout due to PRLO frame received

DupWwn – Logout due to duplicate worldwide name received on a PLOGI

Plogi – Logout due to another PLOGI from the same port

PlogLru – Logout due to more than our max number of ports supported exceeded (The least recently used port is logged out)

Logo3p – Logout due to TPRLO (third party logout)

NmSrvr – Logout of name server

EchoTst – Logout of port whom we sent ECHO to (temporary login)

Quiesce – Logout due to quiescence during “link down”

LupChg – Logout due to “link up” with change in connection topology (switch from loop to fabric or point-to-point, or any other combination)

NewFab – Logout due to attachment to a new fabric

PlogPtp – Logout due to point-to-point PLOGI received

Iogen – Logout due to IOGEN (debug only)

DiscTO – Logout due to discovery timeout after LIP

FabPort – Logout due to attachment to different port on same fabric

FlogFai – Logout due to FLOGI failure

LipReas – These are reasons why we issued LIP.

- Unk – Unknown
- BbCred – LIP since we don't think we're advertising BB credit (self-check failed)
- OwnFlog – We received our own FLOGI.
- IniFail – Initialization failed
- Force – LIP forced by “goFix” command
- LipHc – LIP due to LIP received while we were in host control mode
- Reconf – LIP due to reconfiguration (probably for EDTOV)
- FlgFail – LIP due to FLOGI failure
- PtpFail – LIP due to Point-to-point failure
- TgtRst – LIP due to Target reset
- NonPart – LIP to go non-participating
- Reboot – LIP due to reboot
- ChgAlpa – LIP due to us changing ALPA
- ExitFla – LIP due to us exiting Fabric loop (entering Private loop)
- Flush – LIP due to SEST flush
- ChReset – LIP due to Tachyon chip reset
- BlkFifo – LIP due to Blocked outbound Fifo (host has run out of BB credit)
- NOS – LIP due to NOS received
- Fatal – LIP due to fatal error
- Elastic – LIP due to elastic store error
- LnkFail – LIP due to link failure
- LnkStuk – LIP due to link stuck for more than one second

Discard – These are reasons for discarding frames.

- Xid – Discard due to invalid RXID
- Ratov – Discard due to exchange in error
- Other – Discard due to other reasons
- UnData – Discard due to unexpected data
- InvRO – Discard due to invalid relative offset received
- SestVal – Discard due to SEST entry invalidated
- NoFhRO – Discard due to relative offset bit not set in the F_CTL of data frame

4.3.1.02 fc 3 (list of open exchanges)

```

-> fc 3

Open Exchanges

7. Link errors detected with link up; count of bad characters received
8. Count of outbound exc recov; number of frames discarded
9. Link downs; link failures; LIPs sent; LIP-F7s sent; Tachyon resets; Tach buf warnings; elastic stores; host controls; link stuck count
10. First LIPF from this ALPA; last LIPF from this ALPA
11. SCBs in use; max queue depth seen; biggest available buffer
12. Current Frame Mgr status; current Tachyon status
13. Driver status flags
14. More driver status flags

4.3.1.04 fc 6 (Frame Mgr Status Log)

This is a log of the Tachyon Frame Manager statuses which have been read from the chip. If you are very familiar with Tachyon and the driver it will be useful in debugging “link-down-up” error recovery.

(4.x version)

4.3.1.07 fc 10 (host login list)

List of Hosts who have performed login.
(4.x version)

```

-> fc 10

Active dstNPort Q

Port: 0xfffffe (0x01e6d7a4):   active | FCP: no | WWN: 00000000-00000000
Port: 0x0000dc (0x01e6d86c):   active | FCP: yes | WWN: 100000a0-b8028003
Port: 0x0000da (0x01e6d934):   active | FCP: yes | WWN: 100000a0-b802116b
(Count = 3)
    
```

NOTES: a. Port 0xfffffe is not a host. It is used to talk to the fabric.
 b. "active" means that we are free to send frames to that port.
 c. "FCP yes" means that port has performed a SCSI login (PRLI)
 d. "WWN" is the worldwide name used by that port.

(5.x & 6.x versions)

NOTES:

Link err stat counts: Should be zero. They may be non-zero after a link failure caused by power-cycling or rebooting a machine on the loop. To get accurate information, zero these counts after all devices are up on the loop by entering “fc 90”.

LIPF alpa: Identifies the port which detected a break in the loop on its receiver side.

4.3.1.11 Clear Counters (fc90)

06.15 and lower

Clears all counters found in “fc 2 and fc 20” back to zero. Use **fcAll 90** to clear counters on all channels.

06.16 and higher

Use the command **iopPerfMonRestart**

4.3.1.12 Clearing the accumulated totals and the trace (fc 91)

06.15 and lower

In order to clear all trace information, as well as perform the functions of “fc 90” (for the chip defined by fcChip). To clear this data for all chips, enter use **fcAll 91**.

06.16 and higher

Use the command **iopPerfMonRestart**

4.3.1.13 fc 100 (World Wide Name change information)

This command displays the last time the WWN changed and calls the **fcNames** command at the end.

```
-> fc 100

4.3.1.14 fcNames (How to get worldwide names for all the channels)

This function provides a concise listing of all the port names and node names that the controller uses on the various fibre channels. It also provides a listing of all the TGV structure addresses. The TGV is the major driver data structure used to control each channel.

```
-> fcNames

CHIP  PortName                NodeName                TGV Adrs
0     200100a0-b8001356      200000a0-b8001356      03bdd77c

Displays the link speed of each of the fibre channel loops

4.3.1.17 fcAll (How to get an overall status)

Chip: This field identifies the TachLite chip and what side it is connected to. Within the controller, there are 6 chips. There are 4 destination-side (Dst) chips (channels 0-3) and 2 source-side (Src) chips (channels 0-1). Depending upon the order in which the array initializes, the destination-side or the source-side chips may be listed first.

LinkStat: This field tells whether the link is “up” or “down” on this channel. Since the SYM 1200 employs minihubs, the link is normally up unless the minihub is absent, regardless of whether or not any cables are attached to the minihub. This field also lists the type of connection: “Loop”= private loop, “Fla”=public loop, “Fab”=direct fabric attach, or “Ptp”=point-to-point.

OurPortId: This field identifies what the controller’s port ID is on this channel. For private loop configurations, this is normally a one-byte field. For fabric or public loop configurations, this is normally a three-byte field.

Num Port Logins: This field identifies how many fibre channel devices have a valid login with us. A valid login means that we have at least completed PLOGI.

Exchanges: The next three fields deal with exchanges.

The “open exchanges” field tells how many exchanges we have open on this channel (ie unfinished exchanges). Typically, an exchange equates to a SCSI command. However, this is not necessarily the case, as PLOGIs, ECHOs, and other link services commands are also exchanges. From an internal viewpoint, for each open exchange, there is an XCB structure, and these may be viewed by using the “fc 3” function.

The “total exchanges” field tells how many exchanges we have processed on this channel. Most of these exchanges will probably be closed and no longer active. You can use this field to see how much activity we have had on this channel.

The “error exchanges” field tells how many exchanges were terminated abnormally. A check condition is not necessarily an abnormal termination. This field is incremented whenever an XCB is marked in error.

Link Down: This field tells how many times the link went down on this channel. Normally this tells you how many LIPs or Link Resets we observed or caused.

Bad Char: This field tells how many bad characters were detected by TachLite while the link was up.

Bad Frames: This field tells how many low-level transmission-reception errors were detected by TachLite on this channel while the link was up. This includes “CRC errors”, and “discarded frames”. If we show “Bad Frames”, then we probably have some component problems which will likely cause a “Link Down” shortly.

```
-> fcAll

```

4.3.1.18 fcTail (Display last few entries of each log)

04.xx only

To display only the last few entries in a log, use the “fcTail” function:

fcTail <log id>, <number of entries to display>

For example, to display the last 20 lines of the event log, enter: **fcTail 8, 20**

To display the last 20 lines of all event logs, enter: **fcTailAll 8, 20**

4.3.1.19 fcHosts

Displays information about the host side login. Using the command by itself will give usage information. Each higher number of view gives more detail than the previous version. Functionally the same as **fc 111** and similar to **fcNames**.

```
-> fcHosts

-> fcHosts 4

LogCode Cnt = Number of consecutive occurrences of this logCode event
LogCode Type = IO types which had these events: (Read Write Other NonScsi)
GoodIo Cnt = Number of IOs returned with good status after 1st occurrence
GoodIo Type = IO types of the IOs which returned good status
Outstand Cnt = Number of outstanding IOs when 1st occurrence logged
Outstand Type = IO types of the outstanding IOs
    
```

4.3.1.20 fcDump

Dumps detailed fc errors and statistics for all chips. Includes fcAll output for the following fc commands:

06.15 and lower

fc 1, fcAll 2, fcAll 3, fcAll 6, fcAll 8, fcAll 10, fcAll 20, fc 13, moduleList

06.16 and higher

fcAll, fcAll 2, fcAll 20, fcAll 13, fcAll 49, fc 1, fcAll 43, fc 100, fc 101, fc 102, fc 103, fc 110, fc 112.

4.3.2 fcDevs

All fcDevs commands are for 06.15 and lower firmware levels.

The **fcDevs** command provides most of the debug information gathered by the destination high level driver (HDD). This command provides information about all of the destination devices in terms of “views”. The general form of the **fcDevs** command is:

```

-> fcDevs
fcDevs <view>, <devNum (0=all)>
  1 = All views by view type (active)
  2 = Inquiry view
  3 = Names view
  4 = Path view
  5 = Common names view
  6 = Buf view
  7 = Detail view (All luns)
  8 = Detail view (Active luns only)
  9 = All views by lun device
 10 = All views by view type (detailed)
 11 = Rls view
 12 = Devices with any errors
 13 = Devices with Rw errors returned to VDD
 14 = Devices with major errors
    
```

Each view also provides a logical devNum to Tray/Slot to ALPA cross reference for each device.

4.3.2.01 fcDevs 1 - All Views by View Type (Active)

This view lists active devices by view type. See **fcDevs 10**.

4.3.2.02 fcDevs 2 - Inquiry View

This view provides the standard inquiry information returned from the devices. If the “state” is OPEN, then the drive is considered to be usable by VDD, whereas if the “state” is CLOSED, then the drive is considered to be unusable. This view is also useful in determining firmware levels of drives and ESMs.

4.3.2.03 fcDevs 3 – Names View

This view provides the volume ID and the device name. The device name is the fibre channel node name for the device. For a disk device, the volume ID is either the serial number provided on Inquiry VPD Page 80 or Page 83, or it is the device name. For an enclosure device, the volume ID is the enclosure logical ID. For a processor device, the volume ID is “INFINITI”.

4.3.2.04 fcDevs 4 – Path View

This view tells what paths are available to each device and what the ALPAs, current loop IDs, and hard loop IDs are for each device. For example, in the “PathByChan” column, if you see a “C” under “c2”, then channel 2 is the current path for that device. Normally the ALPAs are the same for the same device on each channel, but that is not required. The “current loop ID” is the one-to-one translation of the “ALPA”. The “hard loop ID” is the loop ID which the device would like to have, provided there is no conflict with another device.

4.3.2.05 fcDevs 5 – Common Names View

This view provides a way to translate drive Inquiry data to a common name for that device. For example, several types of Seagate Cheetah drives are commonly used, and rather than memorizing what an ST318203FC drive is, one can now easily see that it is a Cheetah-3 low-profile 18 gigabyte drive.

4.3.2.06 fcDevs 6 – Bufs View

This view provides a quick count of all the IOs queued for each device. Reads and writes, which have been sent to the LLD, will be included in the “Rw” column. Non read-write IOs, which have been sent to the LLD, will be included in the “NRw” column. The other 3-6 columns represent IOs which are queued at the HDD level. The “Err” (error) queue is reserved for target resets and device resets. The “Con” (continue) queue is reserved for async opens, block reassigns, and a few other higher priority things. “Q1-Q4” are lower priority queues, which commonly used for normal IOs from the upper layers. For a disk device, only Q1 exists, and that is just the normal IO request queue. For a processor device, Q1-Q4 exist: Q1=SCSICON IOs, Q2=Mirror Write for Mirror Read, Q3=Mirror Read, and Q4=Mirror Write. (4.x version)

4.3.2.07 fcDevs 7 - Detail (All Luns) View and fcDevs 8 - Detail (Active Luns Only) View

These views really get in to the low level implementation of the HDD driver. They list a lot of detail about each of the devices. These two views are identical, except that “fcDevs 8” only lists devices which have active IOs or are involved in error recovery. These views first list a translation of the “lun flags”. They then display the addresses of all the bufs which are queued to each of the queues. They then display low level detail info about the lunInfo, deviceInfo, and all of the pathInfo structures. The blocking tag (if set) is the reason we are not issuing any more IOs to this device. These views are typically reserved for use by the system analysts.

4.3.2.08 fcDevs 9 - All Views by LUN Device

Views all volume devices in volume order.

4.3.2.09 fcDevs 10 - All Views by View Type (Detailed)

This provides detailed output of all of the views in view order. Similar to fcDevs 1 but includes all devices not just active devices.

4.3.2.10 fcDevs 11 - RLS View

This view provides statistics on any Read Link Status Diagnostics data. The information provided can aid in the search for problems within the drive side loops of the storage array. The replacement command as of 6.16 and later code is **fcnShow 11**.

4.3.2.11 fcDevs 12 - Devices with any Errors

Lists information about any devices that have errors being reported.

4.3.2.12 fcDevs 13 - Devices with RW Errors Returned by VDD

Devices with only Read/Write errors that have been reported to the Virtual Disk Driver (VDD).

4.3.2.13 fcDevs 14 - Devices with Major Errors

View of any device that is reporting any major errors.

4.3.2.14 hddDump

06.15 and lower

Dumps detailed hdd errors on a per drive basis. Includes output from the following fcDevs commands:

- fcDevs 2
- fcDevs 3
- fcDevs 4
- fcDevs 5
- fcDevs 6
- fcDevs 7
- fcDevs 11
- fcDevs 12
- fcDevs 13
- fcDevs 14

06.16 and higher

There is no equivalent single command to perform this function.

5. ION Driver Commands

5.1 Overview

The ION driver is the replacement of the older Fibre Channel drive side (back-end) drivers previously used. The new drivers are designed to not only support Fibre drives, but also Serial ATA (SATA), Serially Attached SCSI (SAS) and other future drive protocols. This is the first stage in the complete update of the controller firmware.

The ION family of commands includes **lu**, **ch**, **iditn**, **tditn**, **idloc**, **idcmd** and **ionShow**. Along with these commands there are a couple of related sub-families, **fcn** and **sas**. We also have expanded the **ssm** family of commands as part of the back-end code update. These commands will be discussed in this chapter.

5.1.1 ion Commands

Each ch, lu, iditn, or tditn record begins with an attention character followed by '<' to get your attention (blank means things look normal):

	Channel	Logical Unit	Initiator Driver ITN	Target Driver ITN
-<	down	no itns conn	disconn	disconn
=<	ext down	rejecting IO req's	rejecting IO req's	on ext down channel
#<	blocked	restrict/suspended	blocked by LID	N/A
d<	degraded	look at ORP	degraded	N/A

5.1.1.01 ionHelp

There are two basic versions of the ionHelp output (see below) based on the controller firmware version.

(6.16 version)

```
-> ionHelp
CH - CHANNELS:
-----
chall [level] ..... level = 0  All Channel Summary
                               1  Connected Trays
                               2  ITN Counts
                               3  IO Statistics
                               99 All of the above
ch channel [level] ..... 0  Summary
                               >= 3 IO Detail

5.1.1.03 lu and luall

The lu command examines a single device path information. The luall command provides path information for all drive side devices and is the follow on replacement for the older fcDevs 4 command

The basic syntax is: lu 0xc0000i

Explanation of the Operation-Redundancy-Performance (ORP) and Channels (either Init Chs or Channels) columns.

```
ORP columns indicate the overall state of the lu for disk device types (normally, should be "+++").

O=operation - the state of the ITN currently chosen
+) chosen itn is not degraded
d) chosen itn is degraded

R=redundancy - the state of the redundant ITN
+) alternate itn is up
d) alternate itn is degraded
-) alternate itn is down
x) there is no alternate itn

P=performance - Are we using the preferred path?
+) chosen itn is preferred
-) chosen itn is not preferred
) no itn preferences

The Channels column indicates the state of the itn on that channel which is for its lu.

*) up & chosen
+) up & not chosen
D) degraded & chosen
d) degraded & not chosen
-) down
x) not present
```

The basic syntax is: `iditn 0xc0000i`

Ah = Refers to the A controllers host (h) side connection. If this were the B controller then it would be Bh.
Am = Refers to the A controllers media (drive) side connection.
Bm = Refers to the B controllers media (drive) side connection.
IAC = Inter-Array Communication (RVM)
RmtA = Remote A controller connection (RVM).

5.1.1.05 tditn and tditnall

The tditn command examines a single device target I-T-N Nexus information. The tditnall command provides target I-T-N Nexus information for all host side connection. The tditnall command replaces the fc111 command and is also similar to the information from fcHosts 1.

The basic syntax is: `tditn x` (x = tditn number from the tditnall output.)

Ah = Refers to the A controllers host (h) side connection. If this were the B controller then it would be Bh.
Am = Refers to the A controllers media (drive) side connection.
Bm = Refers to the B controllers media (drive) side connection.
IAC = Inter-Array Communication (RVM)
RmtA = Remote A controller connection (RVM).

(6.16)

5.1.1.07 ionShow 12

The ionShow 12 command replaces fcDevs 2 function to check the open/closed state of a device. **Note:** Drive capacity is shown in hexadecimal blocks. To calculate the size of the drive take the capacity of the drive and convert to decimal then divide by 2 (2 x 512 bytes/block = 1024 bytes or 1KB).

```
-> ionShow 12

5.1.1.08 ionShow 99

The ionShow 99 command performs the following commands:

- chall 0 - Summary channel information
- luall 0 - Summary logical unit information
- iditnall 0- Summary drive side information
- tditnall 0- Summary host side information
- chall 1 - Channel I/O breakdown
- luall 1 - Logical unit I/O breakdown
- iditnall 1- Drive side I/O breakdown
- tditnall 1- Host side I/O breakdown
- chall 2 - Channel I/O errors
- luall 2 - Logical unit I/O errors
- iditnall 2- Drive side I/O errors
- tditnall 2- Host side I/O errors
- fcall 10 - Misc. chip information

This command can be used to gather detailed information to aid troubleshooting.

5.1.1.09 Controller I/O Breakdown

The commands **chall 4**, **luall 4**, **iditnall 4** and **tditnall 4** can be used to help check controllers for possible problems. These commands can be used in conjunction with **ionShow 99** to aid in troubleshooting.

5.2.1.01 hids 104 or 'h'

The hids 104 or 'h' command provides an explanation of various items that will show up when running hids commands.

```

-> hids 104
      or
-> hids 'h'

=====
                        Explanations
=====

1. LUs and ITNs can have only one DEVICE.
2. A DEVICE can have many LUs and ITNs.

ROLES
Am or Bm = MediaSide port for A or B controller.
Ah or Bh = Hostside port for A or B controller.
Encl = An Enclosure
FCdr = A Fibre Channel Drive
RmtA = A port for Remote Mirroring

ITN STATE
++ (Wkng-Norm) = Working-normal
WD (Wkng-Degr) = Working-degraded
WR (Wkng-Rest) = Working-restricted
QD (Qing-Dcon) = Queueing-disconnected
QS (Qing-Susp) = Queueing-suspended
QB (Qing-Blck) = Queueing-blocked
FI (Fail-Ioer) = Fail-Ioerr
FM (Fail-Miss) = Fail-Missing
    
```

5.2.1.02 hids 2

The hids 2 command is a SAS only command and provides basic status information. **Note:** When using hids commands of SAS system (6.17 firmware) that if “Autoprompt” is enabled then you will always have a list of the hids functions that are available at the end of the output.

```
-> hids 2

```

5.2.1.05 hids 108

The hids 108 command shows all of the drive side devices information. Use **hids 104** for explanation of headers.

Note: Drive capacity is shown in decimal blocks. To calculate the size of the drive take the capacity of the drive and divide by 2 (2 x 512 bytes/block = 1024 bytes or 1KB). The capacity of non-drive devices should be ignored.

```
-> hids 108

5.3.1 fcn Commands

Like the ion and hids command sets, the fcn command set replaces functions from older firmware commands and it too is part of the ION driver update.

5.3.1.01 fcnHelp

Assistance with the usage of the fcn commands is provided with this command. Unlike the hids commands, the fcn command set is uniform across all firmware levels starting at 6.16.

```
-> fcnHelp
fcnShowChannel <channel#>[,level]
fcnShow        [level: 0-Basic 9-Details 10-Enclosures 11-RLS Stats]
fcnRls         [0-SetBaseline 1-Update 2-SetPoll [parm]]
fcnChannelReport [level 0-default, 1-Detailed (All), 2-Detailed [,channel]]
fcnCMCClearCounts [level 0-Clear counters (All), 1-Clear counters [,channel]]
```

5.3.1.02 fcnShow

A complete overview of a storage system's controller/drive trays along with the Channel, ITN, WWNN, WWPNN, Role, Port ID, Loop position and physical tray/slot information plus topology data is provided with this command.

```

-> fcnShow

5.3.1.03 fcnShow 11 and fcnRls

This is the replacement command for fcDevs 11 which provides Read Link Status (RLS) information. The RLS counters can be cleared, updated or a new baseline set using the fcnRls command.

```

-> fcnShow 11

5.3.1.02 fcnChannelReport and fcnCMClearCounts

This command is very useful in determining the status of each of the channels. These counts can be cleared using the **fcnCMClearCounts** command. Using the command by itself will provide a simple representation of the status of the channels.

```
-> fcnChannelReport

LinkUps:      < > UpNeverDown <+> UpWasDown
LinkDowns:    <-> Down          <=> DownExtended <x> DownFailed/Missing
Unstable:     <~> LinkGoingUpAndDown( 5 LinkUps in 30 Seconds )

value = 178 = 0xb2
-> 01/29/07-22:34:13 (GMT) (tShell): NOTE: fcnChannelReport ==> 0 1 =2 3
```

Using the "1" parameter after the command will provide detailed information about each of the channels.

```
-> fcnChannelReport 1

```

5.4 Serially Attached SCSI (SAS)

While the SAS drivers are a subset of the ION drivers, it is noteworthy to maintain a separate section for these commands. Initially, SAS will be used for price band 1-3 storage systems. However SAS will eventually be used in the larger price band 4-6 systems.

5.4.1.01 sasHelp

Like many of the other new command sets, the SAS commands now have some help information to provide assistance.

```

-> sasHelp

Helpful commands when debugging sas-sata problems

sasShowIocData (ioc)      - ioc number (0 - max)
sasIoDqLevel              - off(0) by default
sasDqLevel                - =2 by default
sasSAODqLevel             - =2 by default
sasShowChannels           - Current channel status
sasShowCmdBuffers (0/1)  - Current outstanding target(host side) operations

```

```

sasShowCounts (0/1) - list the number of outstanding mf(s) -l list all mpiValues
sasShowAll (mpiValue) - All active message frames (mf)
sasShowBuf (buf) - Current mf and ssc information associated with a buf, if
active
sasShowMfIdx (ioc, req_idx) - mf Details
sasShowMf (mf) - mf Details
sasShowSscIdx (ioc, req_idx) - ssc Details
sasShowSsc (ssc) - ssc Details
sasShowHosts - Hosts Info
sasShowDevices - Device Info
sasShowAllExpanders - Expander Info
sasShowExpanders (ch, lev) - Show Expander Info on channel
sasShowPhyErrStats - Shows error stats for all backend devices
sasSAOMenu - Several SATA affiliation routines
sasShowEnclMap - Displays Encls, Levels (on each channel) and Id
sasShowWorker - Prints the status of the SAS Worker
sasShowMiswires - Displays miswire info for the array
sasShowAllSasPhyInfo (ioc) - Show All SasPhyInfo structure for a IOC
sasShowSasPhyInfo (ioc, phy) - Show SasPhyInfo structure
ionShow - Shows the current connection state for devices

DebugOnly
sasExpfwdl=1 - Forces Expander Code download
expdlDebug=3 - Prints Expander Info during boot
sasResetCtrlExp - Resets the Expander - may cause IO failures
sasDiscoveryDebug=1 - Prints lots of extra debug stuff during boot
sasShowLastChanEnclSlot(b,t) - Shows the last C/E/S for this bus target
    
```

5.4.1.02 sasShowChannels

Used to monitor the SAS channels.

```

-> sasShowChannels
ch: 0 - DRIVE, dev: 500a0b82fbc3d000, path: 500a0b82fbc3d001, role: Bm, ioc: 0, portInfo:
2,2,2, numLevels: 1
ch: 1 - DRIVE, dev: 500a0b82fbc3d000, path: 500a0b82fbc3d000, role: Bm, ioc: 0, portInfo:
0,2,2, numLevels: 1
ch: 2 - HOST, dev: 500a0b82fc0f7004, path: 500a0b82fbc3d004, role: Bh, ioc: 0, portInfo:
4,4,0, numLevels: 0
    
```

5.4.1.03 sasShowMiswires

Can also use the shell command **sasShowPhyErrStats** to aid in troubleshooting cabling issues between trays.

5.4.1.04 sasShowPhyErrStats

Used to isolate bad cables between SAS expansion trays. The SAS PHY Error Statistics data is collected using the storage management softwares gather all support data function. The data generated by that feature can be read from the shell using this command.

The “External” 4-wide ports on the expanders are highlighted in **red**. These are the ports that attach to the next expansion box via cables. If one of these cables was bad, it could be indicated by high error counts.

```

-> sasShowPhyErrStats 1

This is the Controller in slot A
Time since last clear: 0 days, 0 hours, 48 minutes, 30 seconds

5.5 Subsystem Monitor (SSM)

The subsystem monitor system is used to check the condition of the enclosure trays.

5.5.1.01 ssmHelp

This list the SSM commands that can be used to determine the status of various componets.

```

-> ssmHelp
ssmGetCptTree <options>[,<trayid>] - print the internal Component Tree
    options : 0 - all enclosures, common statuses
             : 1 - just one enclosure identified by <trayid>
             : 2 - w/ other status data
             : 4 - w/ VPD infomation

ssmGetDependSts - print the status of the Dependency LEDs

ssmGetCallbackQ - get the maximum depth of the Callback Queue

ssmGetAlarmSts - get the Audible Alarm Status

ssmGetTempSensor - get the Temperature Sensor Thresholds & Temperature

ssmGetActiveDevnums - get a list of active devnums from ION

ssmSetDependSts <cpt>,<sts> - set the status of Dependency critical components
    cpt : 1 - Controller A
         : 2 - Controller B
         : 3 - Support Module A
         : 4 - Support Module B
         : 5 - Interconnect CRU
         : 6 - Battery CRU A
         : 7 - Battery CRU B
         : 8 - Power Supply A
         : 9 - Power Supply B
         : 10 - Data Path A
         : 11 - Data Path B
    sts : 0 - use actual component status
         : 1 - forced status - device OKAY
         : 2 - forced status - device FAILED
         : 5 - forced status - device MISSING

ssmSetServiceRequest <cpt>,<mode> - set the Service Request flag for a component
    cpt : 1 - Controller A
         : 2 - Controller B
         : 3 - Support Module A
         : 4 - Support Module B
         : 5 - Interconnect CRU
         : 6 - Battery CRU A
         : 7 - Battery CRU B
    mode : 1 - disable Service Allowed mode
         : 2 - enable Service Allowed mode
         : 3 - request Service ON
         : 4 - request Service OFF

ssmSetAlarm <trayid>, <option> - set tray alarm state
    option : 1 - Enable the audible alarm
           : 2 - Disable the audible alarm
           : 3 - Mute the audible alarm

ssmSetTempSensor <warning>, <critical> - set the temp sensor thresholds
    warning : -1 - set the temp sensor warning threshold to its default
             : WW - set the temp sensor warning threshold to WW (Celsius)
    critical : -1 - set the temp sensor critical threshold to its default
             : <= WW - set the temp sensor critical threshold to (WW+5)
             : CC - set the temp sensor critical thershold to CC

ssmClearEnclSocPage <traynum>, <esmslot> - clear SBOD ESM SOC diagnostic page (page x81)
    traynum : Tray Id {0-7,0-7}
    esmslot : Esm A {1}, ESM B {2}

clearEnclPage81 <traynum> - clear page x81 stats for specified SBOD tray

clearEnclosuresPage81 - clear page x81 stats for all SBOD trays

ssmDumpEncl <enclid>,<option> - print information about a particular enclosure
    enclid : <pathid> - find the enclosure by its Path Id
           : <trayid> - find the enclosure by its Tray Id
    option : -1 - enclosure all Pages
           : 1 - enclosure CFG Page

```

```

: 2 - enclosure STS Page
: 3 - enclosure INQ Page
: 4 - enclosure VPD Page
: 5 - enclosure SOC Page
: 6 - enclosure CTL Page

ssmDumpHost <option> - print information sent to Host
option :-1 - all Pages
: 1 - CFG Page
: 2 - STS Page
: 3 - DriveArray Page
: 4 - Translation Page

ssmDumpBCM <option> - print information available in BCM
option :-1 - all Tables
: 1 - Subsystem Table (NVS RAM options)
: 2 - Array Table (more NVSRAM options)
: 3 - Line/Status Table

ssmDumpSesList - build & dump the SES List
ssmDumpBypassDrives - build & dump the Drive List
ssmDumpAllocBlocks - print allocated buffers history
ssmShowEnclosures <option> - print information about all enclosures
option : 0 - Tray information
: 1 - Disk information
: 2 - More information

ssmShowEncl <enclid>,<option> - print information about a particular enclosure
enclid : <pathid> - find the enclosure by its Path Id
: <trayid> - find the enclosure by its Tray Id
option :-1 - enclosure all Pages
: 1 - enclosure CFG Page
: 2 - enclosure STS Page
: 3 - enclosure INQ Page
: 4 - enclosure VPD Page
: 5 - enclosure SOC Page
: 6 - enclosure CTL Page

ssmShowHost <option> - print information sent to Host
option :-1 - all Pages
: 1 - CFG Page
: 2 - STS Page
: 3 - DriveArray Page
: 4 - Translation Page

showEnclosuresPage81 - display page x81 stats for all SBOD enclosures

```

5.5.1.02 ssmShow

These SSM commands are designed to monitor enclosures and information that is sent to hosts. This is an abbreviated list of `ssmHelp`. This command does not work with SAS systems.

```

-> ssmShow
ssmShowEnclosures <option> - print information about all enclosures
option : 0 - Tray information
: 1 - Disk information
: 2 - More information

ssmShowEncl <enclid>,<option> - print information about a particular enclosure
enclid : <pathid> - find the enclosure by its Path Id
: <trayid> - find the enclosure by its Tray Id
option :-1 - enclosure all Pages
: 1 - enclosure CFG Page
: 2 - enclosure STS Page
: 3 - enclosure INQ Page
: 4 - enclosure VPD Page
: 5 - enclosure SOC Page
: 6 - enclosure CTL Page

ssmShowHost <option> - print information sent to Host
option :-1 - all Pages
: 1 - CFG Page
: 2 - STS Page
: 3 - DriveArray Page
: 4 - Translation Page

```

showEnclosuresPage81 - display page x81 stats for all SBOD enclosures

5.5.1.03 ssmShowEnclosures

This command print information about all enclosures.

- option : 0 - Tray information
- : 1 - Disk information
- : 2 - More information

(non-SAS example)

```
-> ssmShowEnclosures
TRAY      TYPE          DATA PATH          STATUS  ERRORS*

5.5.1.04 ssmAudibleAlarm

Use this command to silence an alarm for a single fault event.
 The syntax is: `ssmAudibleAlarm -1,0`

5.5.1.05 ssmIdentifyDrive

Use this command to identify a single drive.
 To flash fault indicator : `ssmIdentifyDrive c,i,1`
 To flash fault indicator : `ssmIdentifyDrive c,i,0`

Appendix

A.1 Destination Driver MEL Events Decoder

(as of 4/2/01)

A.1.1 FIBRE DRIVE-SIDE INTERFACES ONLY

MEL events as logged by the driver go through a bunch of magic to be displayed by the GUI in an intelligible format. This document will allow you to make some sense of major events logged by the destination driver. For a full treatment on the decoding of Major Event Logs (MEL) events see the document “**Major Event Log Specification**”.

Interpreting the Display

In the GUI, events are displayed in the following general format when “View Details” is selected:

```

Date/Time: 6/28/00 4:02 PM
Sequence number: 3982
Event type: 1012
Category: Error
Priority: Informational
Description: Destination driver error
Event specific codes: 0/100/6
Component type: Drive
Component location: None

Raw data:
8e 0f 00 00 00 00 00 00 12 10 11 10 fb 67 52 7c
10 00 10 00 00 01 00 00 00 00 00 00 00 01 10 00
0c 00 12 01 00 00 00 00 00 01 00 00 06 00 00 00
    
```

Much of the pertinent information is available without parsing the raw data, which is in part just the data in the formatted section above it. However, there are a few other items in there of interest.

Raw data contains the following information, which generally corresponds to fields found in the MEL_EVENT structure (melLib.h), with a few enhancements:

<u>Field</u>	<u>Length</u>
sequence number	8 bytes
event number	4 bytes; two compose the identifier and two are flags
timestamp	4 bytes
device	4 bytes
id	4 bytes
origin	2 bytes
lun number	2 bytes
controller	1 byte
ndf	1 byte
dfl	1 byte
fill byte	1 byte
data buffer contents	variable

Here are some details about fields in driver-logged events that are not self-explanatory.

0x1012 -- MEL_EV_DST_DRIVER – Destination driver error

Event Specific Codes x/yy/zz, where
 x = controller slot (0 or 1)
 yy = HDD error code, retrieved from errData (see HDD_STAT table below)

zz = LLD error code, retrieved from errData. It can represent one of two things:
the XCB_STAT code (see XCB_STAT table) if available, or
the HDD error code repeated

I load the last field with a repeat of the HDD_STAT code only because I thought observers would start wondering why it's not being used. This way, it's obvious that it wasn't a case of forgetting to fill in the XCB_STAT code, but rather that there was not an XCB_STAT code available.

Component type

This event will blindly report that the component type is "Drive". It should be noted that the component type is built into the event number in the form of flags. In other words, MEL_EV_DST_DRIVER is a "Drive" event.

Component Location

Typically, Tray and Slot information is reported here. However, if ssm doesn't have this information for a given device number, no location is reported.

0x100A -- MEL_EV_DRIVE_CHK_COND – Check condition

Event Specific Codes **xx/yy/zz**, where

xx = sense key

yy = ASC

zz = ASCQ

Raw Data

The raw data is useful in the case of a check condition, because the sense buffer is displayed in the location reserved for data buffer contents.

0x1206 -- MEL_EV_FC_LINK_ERROR_THRESHOLD – ongoing link problem

0x1207 -- MEL_EV_FC_LINK_ERROR_THRESHOLD_CRITICAL – initial link problem

Component Type

Channel

Component Location

The (one-relative) index of the channel in question will be reported, as well as the channel type (host or drive).

For the events below, no event specific codes are explicitly presented. Drive events will have tray/slot information presented in the component location field. Enclosure events have a universal, vague reference to "Tray Component". It *appears* that for events related to the alternate controller, the *reporting* controller is specified in the location information.

A.3 Engenio Host Sense Data and ASC/ASCQ codes

A.3.1 Host Sense Data

A.3.1.01 Request Sense Data Format

Sense data returned by the Request Sense command is formatted as shown in the table below. Future releases may increase the length of the data up to 255 bytes. The information is defined in the paragraphs following the table.

	7	6	5	4	3	2	1	0
0-17	SCSI Standard Sense Data							
0	Valid	Error Code (0x70 or 0x71)						
1	00							
2	0	0	ILI	0	Sense Key			
3 - 6	Information							
7	Additional Sense Length; 152 (0x98) or 10 (0x0A)							
8 - 11	Command Specific Information							
12	Array Additional Sense Code (ASC)							
13	Array Additional Sense Code Qualifier (ASCQ)							
14	Field Replaceable Unit (FRU)							
15 - 17	SKSV	Sense Key Specific Bytes						
18-40	Error Recovery Information							
18 - 19	Recovery Action(s)							
20	Total Number of Errors (for this operation)							
21	Total Retry Count (for this operation)							
22 - 25	ASC/ASCQ Stack (for multiple errors)							
26 - 33	Additional FRU Information							
34 - 36	Error Specific Information							
37 - 40	Error Detection Point							
41-101	Environment Information							
41 - 50	Original CDB							
51	Host ID							
52-53	Host Descriptor							
54 - 69	Array Board Serial Number							
70 - 73	Array Software Revision Level							
74	Reserved (Zero filled)							
75	LUN Number							
76	LUN Status							
77	Reserved (Zero filled)							
78	Reserved (Zero filled)							
79 - 82	Drive Software Revision Level							
83 - 98	Drive Product ID (from drive Inquiry)							
99 - 100	Array Power-up Status							
101	RAID Level							
102-135	Drive Sense Data							
102-103	Drive Sense Identifier							
104-135	Drive Sense Data							
136 - 155	I/O Identification Area							
136-139	I/O Sequence Number							
140-155	Date and Time Stamp							
156-159	Expansion Area							
156-159	Reserved (Zero filled)							

A.3.1.02 Incorrect Length Indicator (ILI) - Byte 2

This bit is used to inform the host system that the requested non-zero byte transfer length for a Read or Write Long command does not exactly match the available data length. The information field in the sense data will be set to the difference (residue) of the requested length minus the actual length in bytes. Negative values will be indicated by two's complement notation. Since the controller does not support Read or Write Long, this bit is always zero.

A.3.1.03 Sense Key - Byte 2

Possible sense keys returned are shown in the following table:

SENSE KEY	DESCRIPTION
0x00	No Sense
0x01	Recovered Error
0x02	Not Ready
0x03	Medium Error
0x04	Hardware Error
0x05	Illegal Request
0x06	Unit Attention
0x07	Data Protect
0x0B	Aborted Command
0x0E	Miscompare

A.3.1.04 Information Bytes - Bytes 3-6

This field is implemented as defined in the SCSI standard for direct access devices. The information could be any one of the following types of information:

- The unsigned logical block address indicating the location of the error being reported.
- The first invalid logical block address if the sense key indicates an illegal request.

A.3.1.05 Additional Sense Length - Byte 7

This value will indicate the number of additional sense bytes to follow. Some errors cannot return valid data in all of the defined fields. For these errors, invalid fields will be zero-filled unless specified in the SCSI-2 standard as containing 0xFF if invalid.

The value in this field will be 152 (0x98) in most cases. However, there are situations when only the standard sense data will be returned. For these sense blocks, the additional sense length is 10 (0x0A).

A.3.1.06 Command Specific Information - Bytes 8-11

This field is only valid for sense data returned after an unsuccessful Reassign Blocks command. The logical block address of the first defect descriptor not reassigned will be returned in this field. These bytes will be 0xFFFFFFFF if information about the first defect descriptor not reassigned is not available or if all the defects have been reassigned. The command-specific field will always be zero-filled for sense data returned for commands other than Reassign Blocks.

A.3.1.07 Additional Sense Codes - Bytes 12-13

See the section on supported sense codes and qualifiers in Chapter 10 for details on the information returned in these fields.

A.3.1.08 Field Replaceable Unit Code - Byte 14

A non-zero value in this byte identifies a field replaceable unit that has failed or a group of field replaceable modules that includes one or more failed devices. For some Additional Sense Codes, the FRU code must be used to determine where the error occurred. As an example, the Additional Sense Code for SCSI bus parity error is returned for a parity error detected on either the host bus or one of the drive buses. In this case, the FRU field must be evaluated to determine if the error occurred on the host channel or a drive channel.

Because of the large number of replaceable units possible in an array, a single byte is not sufficient to report a unique identifier for each individual field replaceable unit. To provide meaningful information that will decrease field troubleshooting and problem resolution time, FRUs have been grouped. The defined FRU groups are listed below.

FRU CODE	DESCRIPTION
0x01	Host Channel Group
0x02	Controller Drive Interface Group
0x03	Controller Buffer Group
0x04	Controller Array ASIC Group
0x05	Controller Other Group
0x06	Subsystem Group
0x07	Subsystem Configuration Group
0x08	Sub-enclosure Group
0x09	Redundant Controller Group
0x0A-0x0F	Reserved
0x10-0xFF	Drive Groups

Host Channel Group (0x01)

A FRU group consisting of the host SCSI bus, its SCSI interface chip, and all initiators and other targets connected to the bus.

Controller Drive Interface Group (0x02)

A FRU group consisting of the SCSI interface chips on the controller which connect to the drive buses.

Controller Buffer Group (0x03)

A FRU group consisting of the controller logic used to implement the on-board data buffer.

Controller Array ASIC Group(0x04)

A FRU group consisting of the ASICs on the controller associated with the array functions.

Controller Other Group (0x05)

A FRU group consisting of all controller related hardware not associated with another group.

Subsystem Group (0x06)

A FRU group consisting of subsystem components that are monitored by the array controller, such as power supplies, fans, thermal sensors, and AC power monitors. Additional information about the specific failure within this FRU group can be obtained from the additional FRU bytes field of the array sense.

Subsystem Configuration Group (0x07)

A FRU group consisting of subsystem components that are configurable by the user, on which the array controller will display information (such as faults).

Sub-enclosure Group (0x08)

A FRU group consisting of the attached enclosure devices. This group includes the power supplies, environmental monitor, and other subsystem components in the sub-enclosure.

Redundant Controller Group (0x09)

A FRU group consisting of the attached redundant controllers.

Drive Group (0x10 - 0xFF)

A FRU group consisting of a drive (embedded controller, drive electronics, and Head Disk Assembly), its power supply, and the SCSI cable that connects it to the controller; or supporting sub-enclosure environmental electronics. The FRU code designates the channel ID in the most significant nibble and the SCSI ID of the drive in the least significant nibble. To read the devnum value take the first digit of the Drive Group number and subtract one (i.e. Drive Group value of 3b = 0x0020000b = 2, 11).

NOTE: Channel ID 0 is not used because a failure of drive ID 0 on this channel would cause an FRU code of 0x00, which the SCSI-2 standard defines as no specific unit has been identified to have failed or that the data is not available.

A.3.1.09 Sense Key Specific Bytes - Bytes 15-17

This field is valid for a sense key of Illegal Request when the sense-key specific valid (SKSV) bit is on. The sense-key specific field will contain the data defined below. In this release of the software, the field pointer is only supported if the error is in the CDB.

	7	6	5	4	3	2	1	0
15	SKSV	C/D	Reserved		BPV	Bit Pointer		
16	Field Pointer (MSB)							
17	Field Pointer (LSB)							

- C/D = 1 indicates the illegal parameter is in the CDB.
- C/D = 0 indicates that the illegal parameter is in the parameters sent during a Data Out phase.
- BPV = 0 indicates that the value in the Bit Pointer field is not valid.
- BPV = 1 indicates that the Bit Pointer field specifies which bit of the byte designated by the Field Pointer field is in error. When a multiple-bit error exists, the Bit Pointer field will point to the most-significant (left-most) bit of the field.

The Field Pointer field indicates which byte of the CDB or the parameter was in error. Bytes are numbered from zero. When a multiple-byte field is in error, the pointer will point to the most-significant byte.

A.3.1.10 Recovery Actions - Bytes 18-19

This is a bit-significant field that indicates the recovery actions performed by the array controller.

Byte 18:

Bit	Description
0-3	Reserved
4	Drive command retried
5	Failed drive
6	Downed LUN
7	Information logged

Byte 19:

Bit	Description
0	Check data used
1	Reserved
2	Reserved
3	Issued Reassign Block command
4	Issued Start Stop Unit command
5	Reserved
6	Asserted Reset signal on drive channel
7	Reserved

A.3.1.11 Total Number Of Errors - Byte 20

This field contains a count of the total number of errors encountered during execution of the command. The ASC and ASCQ for the last two errors encountered are in the ASC/ASCQ stack field.

A.3.1.12 Total Retry Count - Byte 21

The total retry count is for all errors seen during execution of a single CDB set.

A.3.1.13 ASC/ASCQ Stack - Bytes 22-25

These fields store information when multiple errors are encountered during execution of a command. The ASC/ASCQ pairs are presented in order of most recent to least recent error detected.

A.3.1.14 Additional FRU Information - Bytes 26-33

These bytes provide additional information about the field replaceable unit identified in byte 14. The first two bytes are qualifier bytes that provide details about the FRU in byte 14. Byte 28 is an additional FRU code which identifies a second field replaceable unit. The value in byte 28 can be interpreted using the description for byte 14. Bytes 29 and 30 provide qualifiers for byte 28, just as bytes 26 and 27 provide qualifiers for byte 14. The table below shows the layout of this field. Following the table is a description of the FRU group code qualifiers.

	7	6	5	4	3	2	1	0
26	FRU Group Qualifier for byte 14 (MSB)							
27	FRU Group Qualifier for byte 14 (LSB)							
28	Additional FRU Group Code							
29	Additional FRU Group Code Qualifier (MSB)							
30	Additional FRU Group Code Qualifier (LSB)							
31	2nd Additional FRU Group Code							
32	2nd Additional FRU Group Code Qualifier (MSB)							
33	2nd Additional FRU Group Code Qualifier (LSB)							

FRU Group Qualifiers For The Host Channel Group (Code 0x01)

FRU Group Qualifier - Bytes 26 (MSB) & 27 (LSB) - The most significant byte indicates which host channel is reporting the failed component. The least significant byte provides the device type and state of the device being reported.

Host Channel MSB Format:

Bit	7	6	5	4	3	2	1	0
Field	Mini-Hub Port		Controller Number		Host Channel Number			

Mini-Hub Port indicates which of the Mini-Hub ports is being referenced. For errors where the Mini-Hub port is irrelevant port 0 is specified.

Value	Controller
0	Port 0 - 'IN'
1	Port 1 - 'OUT'
2-3	Reserved

Controller Number indicates which controller the host interface is connected to.

Value	Controller
0	Controller A
1	Controller B
2 - 7	Reserved

Host Channel Number indicates which channel of the specified controller. Values 1 through 4 are valid.

Host Channel LSB Format:

Bit	7	6	5	4	3	2	1	0
Field	Device State				Device Type Identifier			

Host Channel Device State is defined as:

Value	State
0	Optimal
1	Warning
2	Failed
3	Missing
4 - 7	Reserved

Host Channel Device Type Identifier is defined as:

Device Type Identifier	Type of Element
0x00	Unspecified
0x08	Controller electronics
0x0F	SCSI Port/Transceiver (includes GBIC)
0x16	FC "Mini-Hub"

FRU Group Qualifiers For Controller Drive Interface Group (Code 0x02)

FRU Group Qualifier - Bytes 26 (MSB) & 27 (LSB) - The most significant byte indicates which drive channel is reporting the failed component. The least significant byte provides the device type and state of the device being reported.

Drive Channel MSB Format:

Bit	7	6	5	4	3	2	1	0
Field	Mini-Hub Port*		Reserved		Drive Channel Number			

* = Reserved for parallel SCSI

Mini-Hub Port indicates which of the Mini-Hub ports is being referenced. For errors where the Mini-Hub port is irrelevant port 0 is specified.

Value	Controller
0	Port 0 - 'IN'
1	Port 1 - 'OUT'
2-3	Reserved

Drive Channel Number indicates which channel. Values 1 through 6 are valid.

Drive Channel LSB Format (Not used on parallel SCSI):

Bit	7	6	5	4	3	2	1	0
Field	Device State			Device Type Identifier				

Device Interface Channel Device State is defined as:

Value	State
0	Optimal
1	Warning
2	Failed
3	Missing
4 - 7	Reserved

Host Channel Device Type Identifier is defined as:

Device Type Identifier	Type of Element
0x00	Unspecified
0x08	Controller Electronics
0x0F	SCSI Port/Transceiver (includes GBIC)
0x16	FC "Mini-Hub"

FRU Group Qualifiers For The Subsystem Group (Code 0x06)

FRU Group Qualifier - Bytes 26 (MSB) & 27 (LSB) - The most significant byte indicates which primary component fault line is reporting the failed component. The information returned depends on the configuration set up by the user. Refer to the section on Subsystem Fault Data Storage in Chapter 9 for more information. The least significant byte provides the device type and state of the device being reported. The format for the least significant byte is the same as Byte 27 of the FRU Group Qualifier for the Sub-enclosure Group (0x08).

FRU Group Qualifiers For The Sub-enclosure Group (Code 0x08)

FRU Group Qualifier - Bytes 26 (MSB) & 27 (LSB) - The most significant byte indicates which enclosure identifier is reporting the failed component. The least significant byte provides the device type and state of the device being reported.

Statuses are reported such that the first enclosure for each channel is reported, followed by the second enclosure for each channel.

Sub-enclosure MSB Format:

Bit	7	6	5	4	3	2	1	0
Field	TIE	Sub-Enclosure Identifier						

When the Tray Identifier Enable (TIE) bit is set to 01b, the Sub-Enclosure Identifier field provides the tray identifier for the sub-enclosure being described.

When set to 00b, the Sub-enclosure Identifier is defined as:

	Enclosure #1	Enclosure #2
Channel 1	0x01	0x06
Channel 2	0x02	0x07
Channel 3	0x03	0x08
Channel 4	0x04	0x09
Channel 5	0x05	0x0A

Sub-enclosure LSB Format:

Bit	7	6	5	4	3	2	1	0
Field	Device State				Device Type Identifier			

Sub-enclosure Device State is defined as:

Value	State
0	Optimal
1	Warning
2	Failed
3	Missing
4 - 7	Reserved

Sub-enclosure Device Type Identifier is defined as:

Device Type Identifier	Type of Element
0x00	Unspecified
0x01	Device
0x02	Power Supply
0x03	Cooling Element
0x04	Temperature Sensors
0x06	Audible Alarm
0x07	Environmental Services Electronics
0x08	Controller Electronics
0x09	Nonvolatile Cache
0x0A	Reserved
0x0B	Uninterruptible Power Supply
0x0C - 0x0E	Reserved
0x0F	SCSI Port Transceiver
0x10 - 0x15	Reserved
0x16	Sub-Enclosure
0x17-0x1F	Reserved

FRU Group Qualifiers For The Redundant Controller Group (Code 0x09)

FRU Group Qualifier - Bytes 26 (MSB) & 27 (LSB) - The most significant byte indicates which tray contains the failed controller. The least significant byte indicates the failed controller within the tray.

Redundant Controller MSB Format:

Bit	7	6	5	4	3	2	1	0
Tray number of the subsystem that holds the controller								

Redundant Controller LSB Format:

Bit	7	6	5	4	3	2	1	0
Reserved							Controller Number	

The Controller Number field is defined as:

Value	Definition
00b	Controller A
01b	Controller B
01b	Reserved
11b	Reserved

A.3.1.15 Error Specific Information - Bytes 34-36

This field provides information read from the array controller VLSI chips and other sources. It is intended primarily for development testing, and the contents are not specified.

A.3.1.16 Error Detection Point - Bytes 37-40

The error detection point field will indicate where in the software the error was detected. It is intended primarily for development testing, and the contents are not specified.

A.3.1.17 Original CDB - Bytes 41-50

This field contains the original Command Descriptor Block received from the host.

A.3.1.18 Host ID - Byte 51

The host ID is the SCSI ID of the host that selected the array controller for execution of this command.

A.3.1.19 Host Descriptor - Bytes 52-53

This bit position field provides information about the host. Definitions are given below.

LS Byte

Bit	Definition
0	Data is being transferred 16-bit wide
1	Reserved
2	Wide negotiation completed successfully (May have negotiated for 8-bit wide)
3-7	Reserved

MS Byte

Bit	Definition
0	Message-using host
1	Reselectable host
2	Data is being transferred synchronously (Bit off means asynchronous data transfer)
3	Synchronous negotiation successful (May have negotiated for asynchronous)
4	Reserved
5	AEN supported
6	Polled AEN supported
7	Reserved

A.3.1.20 Controller Serial Number - Bytes 54-69

This sixteen-byte field contains the manufacturing identification of the array hardware. Bytes of this field are identical to the information returned by the Unit Serial Number page in the Inquiry Vital Product Data.

A.3.1.21 Array Software Revision - Bytes 70-73

The Array Application Software Revision Level matches that returned by an Inquiry command.

A.3.1.22 LUN Number - Byte 75

The LUN number field is the logical unit number in the Identify message received from the host after selection.

A.3.1.23 LUN Status - Byte 76

This field indicates the status of the LUN. It's contents are defined in the logical array page description in the Mode Parameters section of this specification except for the value of 0xFF, which is unique to this field. A value of 0xFF returned in this byte indicates the LUN is undefined or is currently unavailable (reported at Start of Day before the LUN state is known).

A.3.1.24 Drive Software Revision - Bytes 79-82

This field contains the software revision level of the drive involved in the error if the error was a drive error and the controller was able to retrieve the information.

A.3.1.25 Drive Product ID - Bytes 83-98

This field identifies the Product ID of the drive involved in the error if the error was a drive error and the controller was able to determine this information. This information is obtained from the drive Inquiry command.

A.3.1.26 Array Power-up Status - Bytes 99-100

In this release of the software, these bytes are always set to zero.

A.3.1.27 RAID Level - Byte 101

This byte indicates the configured RAID level for the logical unit returning the sense data. The values that can be returned are 0, 1, 3, 5, or 255. A value of 255 indicates that the LUN RAID level is undefined.

A.3.1.28 Drive Sense Identifier - Bytes 102-103

These bytes identify the source of the sense block returned in the next field. Byte 102 identifies the channel and ID of the drive. Refer to the FRU group codes for physical drive ID assignments. Byte 103 is reserved for identification of a drive logical unit in future implementations and it is always set to zero in this release.

A.3.1.29 Drive Sense Data - Bytes 104-135

For drive detected errors, these fields contain the data returned by the drive in response to the Request Sense command from the array controller. If multiple drive errors occur during the transfer, the sense data from the last error will be returned.

A.3.1.30 Sequence Number - Bytes 136-139

This field contains the controller's internal sequence number for the IO request.

A.3.1.31 Date and Time Stamp - Bytes 140-155

The 16 ASCII characters in this field will be three spaces followed by the month, day, year, hour, minute, second when the error occurred in the following format:

MMDDYY/HHMMSS

A.3.2 Sense Codes

A.3.2.1 Sense Keys

The table below lists the Sense keys returned by the array controller in the sense data.

SENSE KEY	DESCRIPTION
0x00	No Sense
0x01	Recovered Error
0x02	Not Ready
0x03	Medium Error
0x04	Hardware Error
0x05	Illegal Request
0x06	Unit Attention
0x07	Data Protect (Not used)
0x08	Blank Check (Not used)
0x09	Vendor Specific (Not used)
0x0A	Copy Aborted (Not used)
0x0B	Aborted Command
0x0C	Equal (Not used)
0x0D	Volume Overflow (Not used)
0x0E	Miscompare
0x0F	Reserved (Not used)

A.3.2.2 Additional Sense Codes And Qualifiers

This lists the Additional Sense Codes (ASC), and Additional Sense Code Qualifier (ASCQ) values returned by the array controller in the sense data. SCSI-2 defined codes are used when possible. Array specific error codes are used when necessary, and are assigned SCSI-2 vendor unique codes 80-FFH. More detailed sense key information may be obtained from the array controller command descriptions or the SCSI-2 standard.

Codes defined by SCSI-2 and the array vendor specific codes are shown below. The most probable sense keys (listed below for reference) returned for each error are also listed in the table. A sense key encapsulated by parentheses in the table is an indication that the sense key is determined by the value in byte 0x0A of the User-configurable region of the NVSRAM.

ASC	ASCQ	Sense Key	Description
00	00	0	No Additional Sense Information The controller has no sense data available for the requesting host and addressed logical unit combination
04	01	2	Logical Unit is in the Process of Becoming Ready The controller is executing its initialization functions on the addressed logical unit. This includes drive spinup and validation of the drive/logical unit configuration information.
04	04	2	Logical Unit Not Ready, Format In Progress The controller previously received a Format Unit command from an initiator, and is in the process of executing that command.
04	07	2	Logical Unit Not Ready, Operation in Progress The storage controller cannot respond immediately to a PRIN or PROUT command to a logical unit because it is in the process of removing non-persistent registrations and reservations for that volume. This can be expected to occur on the first PRIN or PROUT command to a logical unit having non-persistent registrations and reservations after a controller power cycle.
04	81	2	Storage Module Firmware Incompatible - Manual Code Synchronization Required
04	A1	2	Quiescence Is In Progress or Has Been Achieved
0C	00	4	Unrecovered Write Error Data could not be written to media due to an unrecoverable RAM, battery or drive error.
0C	00	6	Caching Disabled Data caching has been disabled due to loss of mirroring capability or low battery capacity.
0C	01	1	Write Error Recovered with Auto Reallocation The controller recovered a write operation to a drive and no further action is required by the host. Auto reallocation may not have been used, but this is the only standard ASC/ASCQ that tells the initiator that no further actions are required by the driver.

ASC	ASCQ	Sense Key	Description
0C	80	4,(6)	<p>Unrecovered Write Error Due to Non-Volatile Cache Failure</p> <p>The subsystem Non-Volatile cache memory recovery mechanisms failed after a power cycle or reset. This is possibly due to some combination of Battery failure, alternate controller failure or foreign controller.</p> <p>User data may have been lost.</p>
0C	81	4,(6)	<p>Deferred Unrecoverable Error Due to Memory Failure</p> <p>Recovery from a Data Cache error was unsuccessful.</p> <p>User data may have been lost.</p>
11	00	3	<p>Unrecovered Read Error</p> <p>An unrecovered read operation to a drive occurred and the controller has no redundancy to recover the error (RAID 0, degraded RAID 1, degraded mode RAID 3, or degraded RAID 5)</p>
11	8A	6	<p>Miscorrected Data Error - Due to Failed Drive Read</p> <p>A media error has occurred on a read operation during a reconfiguration operation,</p> <p>User data for the LBA indicated has been lost.</p>
18	02	1	<p>Recovered Data - Data Auto Reallocated</p> <p>The controller recovered a read operation to a drive and no further action is required by the host. Auto reallocation may not have been used, but this is the only standard ASC/ASCQ that tells the initiator that no further actions are required by the driver.</p>
1A	00	5	<p>Parameter List Length Error</p> <p>A command was received by the controller that contained a parameter list and the list length in the CDB was less than the length necessary to transfer the data for the command.</p>
20	00	5	<p>Invalid Command Operation Code</p> <p>The controller received a command from the initiator that it does not support.</p>
21	00	5	<p>Logical Block Address Out of Range</p> <p>The controller received a command that requested an operation at a logical block address beyond the capacity of the logical unit. This error could be in response to a request with an illegal starting address or a request that started at a valid logical block address and the number of blocks requested extended beyond the logical unit capacity.</p>
24	00	5	<p>Invalid Field in CDB</p> <p>The controller received a command from the initiator with an unsupported value in one of the fields in the command block.</p>

ASC	ASCQ	Sense Key	Description
25	00	5	<p>Logical Unit Not Supported</p> <p>The addressed logical unit is currently unconfigured. An Add LUN operation in the Logical Array Mode Page must be executed to define the logical unit before it is accessible.</p>
26	00	5	<p>Invalid Field in Parameter List</p> <p>The controller received a command with a parameter list that contained an error. Typical errors that return this code are unsupported mode pages, attempts to change an unchangeable mode parameter, or attempts to set a changeable mode parameter to an unsupported value.</p>
26	04	5	<p>Invalid Release of Persistent Reservation</p> <p>A RELEASE service action is received where the requesting initiator port is a valid persistent reservation holder, but the scope and type fields do not match the scope and type of the established reservation.</p>
27	00	7	<p>Write Protected</p> <p>The addressed LUN is write-protected. In this release, the write protection may have been applied by either the Remote Volume Mirroring feature or the Volume Copy feature.</p>
28	00	6	<p>Not Ready to Ready Transition</p> <p>The controller has completed its initialization operations on the logical unit and it is now ready for access.</p>
29	00	6	<p>Power On, Reset, or Bus Device Reset Occurred</p> <p>The controller has detected one of the above conditions.</p>
29	04	6	<p>Device Internal Reset</p> <p>The controller has reset itself due to an internal error condition.</p>
29	81	(6)	<p>Default Configuration has been Created</p> <p>The controller has completed the process of creating a default logical unit. There is now an accessible logical unit that did not exist previously. The host should execute its device scan to find the new logical unit.</p>
29	82	6	<p>Controller Firmware Changed Through Auto Code Synchronization</p> <p>The controller firmware has been changed through the Auto Code Synchronization (ACS) process.</p>
2A	01	6	<p>Mode Parameters Changed</p> <p>The controller received a request from another initiator to change the mode parameters for the addressed logical unit. This error notifies the current initiator that the change occurred.</p> <p>This error may also be reported in the event that Mode Select parameters changed as a result of a cache synchronization error</p>

ASC	ASCQ	Sense Key	Description
			during the processing of the most recent Mode Select request.
2A	02	6	<p>Log Parameters Changed</p> <p>The controller received a request from another initiator to change the log parameters for the addressed logical unit. This error notifies the current initiator that the change occurred.</p> <p>This error is returned when a Log Select command is issued to clear the AEN log entries.</p>
2A	03	6	<p>Reservations Preempted</p> <p>A command is received that is the next command after clearing of any persistent reservation and registrations as a result of the CLEAR service action to a logical unit having "registrants only" or "all registrants" type of reservation. The condition is reported to all registrants that have been removed, other than the one that delivered the CLEAR service action.</p> <p>If the reservation type is other than "registrants only" or "all registrants," this condition is NOT indicated to any initiator.</p>
2A	04	6	<p>Reservations Released</p> <p>A command is received that is the next command after release of a "registrants only" or "all registrants" persistent reservation. The reservation may be released directly (RELEASE service action), or indirectly as a result of the removal of the last reservation holder or by changing the reservation type. Service actions that can cause these events are RELEASE, PREEMPT, PREEMPT AND ABORT, REGISTER, or REGISTER AND IGNORE. The condition is reported to registrants according to the following rules:</p> <ol style="list-style-type: none"> 1) If the command is RELEASE, it is reported to all registrants, other than the one that delivered the RELEASE service action. 2) If the command is PREEMPT, PREEMPT AND ABORT, REGISTER, or REGISTER AND IGNORE, it is reported to all initiators that did not lose their registration as a result of the service action. <p>If the reservation type is other than "registrants only" or "all registrants," this condition is NOT indicated to any initiator.</p>
2A	05	6	<p>Registrations Preempted</p> <p>A command is received that is the next command after removal of reservation keys for a logical unit having "registrants only" or "all registrants" persistent reservation. Service actions that can cause this event are PREEMPT and PREEMPT AND ABORT. This condition is reported to all initiators that lost their registration as a result of the removal of reservation keys, other than the one that delivered the service action.</p> <p>If the reservation type is other than "registrants only" or "all registrants," this condition is NOT indicated to any initiator.</p>

ASC	ASCQ	Sense Key	Description
2F	00	6	<p>Commands Cleared by Another Initiator</p> <p>The controller received a Clear Queue message from another initiator. This error is to notify the current initiator that the controller cleared the current initiators commands if it had any outstanding.</p>
31	01	1,4	<p>Format Command Failed</p> <p>A Format Unit command issued to a drive returned an unrecoverable error.</p>
32	00	4	<p>Out of Alternates</p> <p>A Re-assign Blocks command to a drive failed.</p>
3F	01	(6)	<p>Drive micro-code changed</p>
3F	0E	6	<p>Reported LUNs data has changed</p> <p>Previously LUN data reported via a Report LUNs command has changed (due to LUN creation/deletion or controller hot swap)</p>
3F	8N	(6)	<p>Drive No Longer Usable</p> <p>The controller has set a drive to a state that prohibits use of the drive. The value of N in the ASCQ indicates the reason why the drive cannot be used.</p> <p>0 - The controller set the drive state to "Failed - Write failure"</p> <p>1 - Not used</p> <p>2 - The controller set the drive state to "Failed" because it was unable to make the drive usable after replacement. A format or reconstruction error occurred.</p> <p>3 - Not used</p> <p>4 - Not used</p> <p>5 - The controller set the drive state to "Failed - No response"</p> <p>6 - The controller set the drive state to "Failed - Format failure"</p> <p>7 - The controller set the drive state to "User failed via Mode Select"</p> <p>8 - Not used</p> <p>9 - The controller set the drive state to "Wrong drive removed/replaced"</p> <p>A - Not used</p> <p>B - The controller set the drive state to "Drive capacity < minimum"</p> <p>C - The controller set the drive state to "Drive has wrong block size"</p> <p>D - The controller set the drive state to "Failed - Controller storage failure"</p>

ASC	ASCQ	Sense Key	Description
			E - Drive failed due to reconstruction failure at Start of Day (SOD)
3F	90	6	Automatic Code Synchronization Successful The automatic code synchronization was completed successfully.
3F	98	(6)	Drive Marked Offline Due to Internal Recovery Procedure An error has occurred during interrupted write processing causing the LUN to transition to the DEAD state. Drives in the drive group that did not experience the read error will transition to the Offline state (0x0B) and log this error.
3F	A1	4	Mini-Hub VPD Access Error An error was encountered while attempting to read or write Mini-Hub VPD Inquiry Data. Some possible causes may be that the Mini-Hub is not present or the VPD data is inaccessible.
3F	BD	(6)	The controller has detected a drive with Mode Select parameters that are not recommended or which could not be changed. Currently this indicates the QErr bit is set incorrectly on the drive specified in the FRU field of the Request Sense data.
3F	C3	(6)	The controller had detected a failed drive side channel specified in the FRU Qualifier field.
3F	C6	(6)	An Overtemp condition has been detected in the controller or drive module.
3F	C7	(6)	Non-media Component Failure The controller has detected the failure of a subsystem component other than a disk or controller. The FRU codes and qualifiers indicate the faulty component.
3F	C8	(6)	AC Power Fail The Uninterruptible Power Source has indicated that AC power is no longer present and the UPS has switched to standby power.
3F	C9	(6)	Standby Power Depletion Imminent The UPS has indicated that its standby power source is nearing depletion. The host should take actions to stop IO activity to the controller.
3F	CA	(6)	Standby Power Source Not at Full Capability The UPS has indicated that its standby power source is not at full capacity.
3F	CB	(6)	AC Power Has Been Restored The UPS has indicated that AC power is now being used to supply power to the controller.
3F	D8	(6)	Cache Battery Life Expiration The cache battery has reached the specified expiration age

ASC	ASCQ	Sense Key	Description
3F	D9	(6)	Cache Battery Life Expiration Warning The cache battery is within the specified number of weeks of failing
3F	E0	(6)	Logical Unit Failure The controller has placed the logical unit in a "dead" state. User data and/or parity can no longer be maintained to ensure availability. The most likely cause is the failure of a single drive in non-redundant configurations or a second drive in a configuration protected by one drive. The data on the logical unit is no longer accessible.
3F	EB	(6)	LUN marked DEAD due to Media Error Failure during SOD An error has occurred during interrupted write processing causing the LUN to transition to the DEAD state
40	NN	4,(6)	Diagnostic Failure on Component NN (0x80 - 0xFF) The controller has detected the failure of an internal controller component. This failure may have been detected during operation as well as during an on-board diagnostic routine. The values of NN supported in this release of the software are listed below. 80 - Processor RAM 81 - RAID Buffer 82 - NVSRAM 83 - RAID Parity Assist (RPA) chip or cache holdup battery 84 - Battery Backed NVSRAM or Clock Failure 91 - Diagnostic Self Test failed non-data transfer components test 92 - Diagnostic Self Test failed data transfer components test 93 - Diagnostic Self Test failed drive Read/Write Buffer data turnaround test 94 - Diagnostic Self Test failed drive Inquiry access test 95 - Diagnostic Self Test failed drive Read/Write data turnaround test 96 - Diagnostic Self Test failed drive Self Test
43	00	4	Message Error The controller attempted to send a message to the host, but the host responded with a Reject message.
44	00	4,B	Internal Target Failure The controller has detected a hardware or software condition that does not allow the requested command to be completed. If the sense key is 0x04 indicating a hardware failure, the

ASC	ASCQ	Sense Key	Description
			controller has detected what it believes is a fatal hardware or software failure and it is unlikely that a retry would be successful. If the sense key is 0x0B indicating an aborted command, the controller has detected what it believes is a temporary software failure that is likely to be recovered if retried.
45	00	1,4	Selection Time-out on a Destination Bus A drive did not respond to selection within a selection time-out period.
47	00	1,B	SCSI Parity Error The controller detected a parity error on the host SCSI bus or one of the drive SCSI buses.
47	80	6	Fibre Link Error The fibre link error thresholds defined in Byte 0x38 of the User Configurable Options NVSRAM region have been exceeded.
48	00	1,B	Initiator Detected Error Message Received The controller received an Initiator Detected Error Message from the host during the operation.
49	00	B	Invalid Message Error The controller received a message from the host that is not supported or was out of context when received.
49	80	B	Drive Reported Reservation Conflict A drive returned a status of reservation conflict.
4B	00	1,4	Data Phase Error The controller encountered an error while transferring data to/from the initiator or to/from one of the drives.
4B	00	B	Source Transfer Error The amount of data received from the host does not match the data transfer length specified.
4E	00	B	Overlapped Commands Attempted The controller received a tagged command while it had an untagged command pending from the same initiator or it received an untagged command while it had a tagged command(s) pending from the same initiator.
55	04	5	Insufficient Registration Resources A PERSISTENT RESERVE OUT command, with service action REGISTER or REGISTER AND IGNORE EXISTING KEY is attempted and there are insufficient resources in the controller to carry out the operation.
5D	80	6	Drive Reported PFA (Predicted Failure Analysis) Condition

ASC	ASCQ	Sense Key	Description
5D	90	6	Controller Reported PFA (Predicted Failure Analysis) Condition
80	02	1,4	Bad ASC code detected by Error/Event Logger
84	00	4,5	Operation Not Allowed With the Logical Unit in its Current State The requested command or Mode Select operation is not allowed with the logical unit in the state indicated in byte 76 of the sense data. Examples would be an attempt to read or write a "dead" logical unit or an attempt to verify or repair parity on a "degraded" logical unit.
84	01	5	Operation Not Allowed – UTM LUN The requested operation could not be performed because it was addressed to the UTM LUN.
84	06	4	LUN Awaiting Format A mode select has been done to create a LUN but the LUN has not been formatted.
84	20	4	Operation Not Allowed – The Snapshot Volume’s Repository is Full The write command is not allowed to a snapshot volume because the snapshot’s repository is full and the Repository Full Policy setting has instructed the controller to fail the snapshot volume (and its repository volume). The Repository Full Policy is controlled by the system administrator.
84	21	4	Operation Not Allowed – The Snapshot Operation has been Stopped. The requested command is not allowed to a snapshot volume because the operation has been stopped by the system administrator.
84	22	4	Operation Not Allowed – The Snapshot Volume’s Repository is Full The write command is not allowed to a volume that has an active snapshot nor to its snapshot volume because the snapshot’s repository is full and the Repository Full Policy setting has instructed the controller to fail writes. Read operations continue to be allowed. The Repository Full Policy is controlled by the system administrator.
84	30	7	Illegal IO Origin The command cannot be processed because a volume acting in the primary role received a read/write command from the remote array.
84	31	7	Read Protected The address LUN is read-protected. In this release, the read protection may have been applied by either the Remote Volume Mirroring feature or the Volume Copy feature.

ASC	ASCQ	Sense Key	Description
85	01	4	Drive IO Request Aborted IO Issued to Failed or Missing drive due to recently failed removed drive. This error can occur as a result of IOs in progress at the time of a failed or removed drive.
87	00	4	Microcode Download Error The controller detected an error while downloading microcode and storing it in non-volatile memory.
87	08	4	Incompatible Board Type For The Code Downloaded
87	0C	6	Download failed due to UTM LUN number conflict
87	0E	6	Controller Configuration Definition Inconsistent with Alternate Controller
88	0A	(6)	Subsystem Monitor NVSRAM values configured incorrectly.
8A	00	5	Illegal Command for Drive Access The initiator attempted to pass a command through to a drive that is not allowed. The command could have been sent in pass through mode or by attempting to download drive microcode.
8A	01	5	Illegal Command for the Current RAID Level The controller received a command that cannot be executed on the logical unit due to its RAID level configuration. Examples are parity verify or repair operations on a RAID 0 logical unit.
8A	20	5	Illegal Command for Current Volume Configuration The controller received a command that cannot be executed due to the current volume configuration.
8B	02	B, (6)	Quiescence Is In Progress or Has Been Achieved
8B	03	B	Quiescence Could Not Be Achieved Within the Quiescence Timeout Period
8B	04	5	Quiescence Is Not Allowed
8E	01	E, (6)	A Parity/Data Mismatch was Detected The controller detected inconsistent parity/data during a parity verification.
91	00	5	General Mode Select Error An error was encountered while processing a Mode Select command.
91	03	5	Illegal Operation for Current Drive State A drive operation was requested through a Mode Select that cannot be executed due to the state of the drive. An example would be a Delete Drive when the drive is part of a LUN.
91	09	5	Illegal Operation with Multiple SubLUNs Defined An operation was requested that cannot be executed when

ASC	ASCQ	Sense Key	Description
			multiple SubLUNs are defined on the drive.
91	33	5	<p>Illegal Operation for Controller State</p> <p>The requested Mode Select operation could not be completed due to the current state of the controller.</p>
91	36	5	<p>Command Lock Violation</p> <p>The controller received a Write Buffer Download Microcode, Send Diagnostic, or Mode Select command, but only one such command is allowed at a time and there was another such command active.</p>
91	50	5	<p>Illegal Operation For Drive Group State</p> <p>An operation was requested that cannot be executed due to the current state of the Drive Group.</p>
91	51	5	<p>Illegal Reconfiguration Request - Legacy Constraint</p> <p>Command could not be completed due to Legacy configuration or definition constraints</p>
91	53	5	<p>Illegal Reconfiguration Request - System Resource Constraint</p> <p>Command could not be completed due to resource limitations of the controller</p>
94	01	5	<p>Invalid Request Due to Current Logical Unit Ownership.</p> <p>The request is illegal because the volume is not owned by the controller receiving the request. Route the request to the alternate controller, if available.</p> <p>If the alternate is not available change the volume ownership from the alternate controller to this controller, then retry the request.</p>
94	02	5	<p>Invalid Request Due to Current Logical Unit Ownership.</p> <p>The request is illegal because this is a mirrored secondary volume and it is not owned by the controller receiving the request. Route the request to the alternate controller in the storage array, the controller owner of this volume.</p> <p>If the alternate controller is not available the request must be failed because you can not transfer ownership of a mirrored secondary volume.</p>
95	01	4	<p>Extended Drive Insertion/Removal Signal</p> <p>The controller has detected the drive insertion/removal signal permanently active.</p>
95	02	(6)	<p>Controller Removal/Replacement Detected or Alternate Controller Released from Reset</p> <p>The controller detected the activation of the signal/signals used to indicate that the alternate controller has been removed or replaced.</p>

ASC	ASCQ	Sense Key	Description
98	01	(6)	The controller has determined that there are multiple sub-enclosures with the same ID value selected.
98	02	(6)	Sub-Enclosure with redundant ESMs specifying different Tray Ids
98	03	(6)	Sub-Enclosure ESMs have different firmware levels
A0	00	(6)	Write Back Caching Could Not Be Enabled The controller could not perform write back caching due to a battery failure or discharge, Two Minute Warning signal from the UPS, or an ICON failure.
A1	00	(6)	Write Back Caching Could Not Be Enabled - RDAC Cache Size Mismatch The controller could not perform write back caching due to the cache sizes of the two controllers in the RDAC pair not matching.
A4	00	(6)	Global Hot Spare Size Insufficient for All Drives in Subsystem. A defined Global Hot Spare is not large enough to cover all of the drives present in the subsystem. Failure of a drive larger than the Global Hot Spare will not be covered by the Global Hot Spare drive.
A6	00	(6)	Recovered processor memory failure The controller has detected and corrected a recoverable error in processor memory.
A7	00	(6)	Recovered data buffer memory error The controller has detected and corrected a recoverable error in the data buffer memory. Sense bytes 34-36 will contain the count of errors encountered and recovered
A8	00	4	General MetaData Error The operation could not be completed because metadata needed to perform the operation is missing, could not be read or has been corrupted.
A8	01	4	Snapshot Repository MetaData Error The operation could not be completed because metadata needed to perform the operation is missing, could not be read or has been corrupted. The metadata resides in the snapshot's repository volume.
C0	00	4,(6)	The Inter-controller Communications Have Failed The controller has detected the failure of the communications link between redundant controllers.
D0	06	4	Drive IO Time-out The controller destination IO timer expired while waiting for a drive command to complete.

ASC	ASCQ	Sense Key	Description
D1	0A	4	<p>Drive Reported Busy Status</p> <p>A drive returned a busy status in response to a command.</p>
E0	NN	4	<p>Destination Channel Error</p> <p>NN = 00 through 07 indicates the Sense Key returned by the drive after a check condition status</p> <p>NN = 10 indicates that a bus level error occurred</p>
E0	NN	6	<p>Fibre Channel Destination Channel Error</p> <p>NN = 20 indicates redundant path is not available to devices</p> <p>NN = 21 indicates destination drive channels are connected to each other</p> <p>Sense Byte 26 will contain the Tray ID.</p> <p>Sense Byte 27 will contain the Channel ID.</p>
E1	NN	4	<p>SATA Drive Error</p> <p>NN = 00 – This indicates that the Frodo SATA chip on the PCI bus timed out while fetching a command descriptor block from ring buffer memory. The path controller for the given drive is switched to the alternate controller and no retries are attempted.</p> <p>NN = 01 – This indicates that framing errors and/or data packet CRC errors are occurring over the high speed serial SATA link and the final (twelfth) retry attempt has been made to the path controller. The path controller for the given drive is switched to the alternate controller at this time.</p>
E1	NN	4	<p>NN = 02 – This indicates that a PRD table entry exceeded the length of the data request, meaning the Frodo chip and the disk drive did not agree on the data transfer length. The path controller for the given drive is switched to the alternate controller at this time.</p> <p>NN = 03 - This indicates that a PRD table entry was shorter than the length of the data request, meaning the Frodo chip and the disk drive did not agree on the data transfer length. The path controller for the given drive is switched to the alternate controller at this time.</p>
E1	NN	4	<p>NN = 04 – This indicates that the disk drive reported an ATA protocol error. Typically this is caused by uncorrectable read errors (media errors) from the device. This can also be caused by the firmware attempting to execute an invalid command sequence. If this is a potentially recoverable ATA errors, retries are attempted. For other errors, the path controller for the given drive is switched to the alternate controller.</p> <p>NN = 05 – This indicates that the Frodo chip encountered a PCI Bus Error during a data DMA phase. This generally means that there was no valid response from memory on the PCI bus. The path controller for the given drive is switched to the alternate</p>

ASC	ASCQ	Sense Key	Description
			<p>controller at this time.</p> <p>NN = 06 - This indicates an unknown SATA channel error.</p> <p>NN = 07 - This indicates that the device was in an invalid state when a read or write request came in from the high level destination driver. The disk may be broken, gone, or out of service.</p> <p>NN = 08 - This indicates that an IOCTL command timed out because of a firmware or hardware error. The path controller for the given drive is switched to the alternate controller at this time.</p> <p>NN = 09 - This indicates that an IOCTL command timed out because of a firmware or hardware error. The path controller for the given drive is switched to the alternate controller at this time.</p>
E1	NN	4	<p>NN = 0A - This indicates that the high-level driver timed out an IO shipping request. This results in a path switch from the alternate controller to the local path.</p>
E1	NN	4	<p>NN = 0B - This is a routine error that indicates that an IO shipping request being processed on the alternate controller has failed.</p> <p>NN = 0C - This indicates that the Frodo chip is stopped because the abort acknowledge interrupt was set in the qdma command register. The firmware uses this bit to abort a sequence of I/O operations when it encounters an error. This results in a path switch from the alternate controller to the local path.</p> <p>NN = 0D - This indicates that during an error recovery attempt, outstanding requests are aborted so that they can be retried in the proper order. These aborts do not get logged in the Mel log.</p>
E1	NN	4	<p>NN = 0E - This indicates that the high level destination driver timed out waiting for a request to complete and released the buffer.</p> <p>NN = 0F - This indicates that during recovery from an ATA error, the amount of time for the retry expired or the number of retries available has been exceeded.</p> <p>NN = 10 - This indicates that there was a fault trying to communicate with the path controller for a given drive. When this occurs, the disk path is switched to the other controller.</p> <p>NN = 11 - This indicates that the signature write in auto signing mode failed. An unsigned disk is not useable and will be put offline.</p>
